Migration costs sting 16-bit users

By Sharon Gaudin
and April Jacobs

OPPOSITE Microsoft Corp.'s efforts to push users to its 32-bit platforms, nearly half of the approximately 72.3 million Windows users (Windows 3.1, 95 and NT) are still struggling to run their legacy 16-bit applications.

shelling out millions to rewrite them and digging deep for costly hardware upgrades.

Those customers will be left further behind when Microsoft this week outlines rollout plans for its 32-bit Windows 98 and Windows NT operating systems at Comdex/Fall '97.

Those plans include two specialized

demonstrations of Windows 98 capabilities — one aimed at consumers, the other at corporate users. The company also will outline its plans for Hydra, its multitier version of NT.

Microsoft has responded to user concerns about migration costs with a number of software tools (see chart, page 141).

However, some users say that isn't enough.

Network manager Keith Thibodeaux called the disparity between the 16- and 32-bit environments the "largest migration pitfall." Thibodeaux, who works at United Companies Lending Corp. in Baton Rouge, La., wouldn't be specific, but he said the move has cost his company millions of dollars.

Tackling T...
in the trenches

IS manager Brian Jaffe rolled up his sleeves to look at which practices can cut total cost of ownership of desktop PCs

Microsoft and other vendors at this week's Comdex/Fall '97 are touting wares that supposedly reduce the total cost of ownership (TCO) of the hodgepodge of PCs in your organization. The gurus agree that TCO can be cut by about 15% by employing "best practices" such as enforcing standards and implementing desktop management technologies.

We asked IS manager Brian Jaffe to identify which TCO-slicing recommendations can really snip a few bucks and which ones are just wishful thinking.

Outsourcing watchword: Renegotiate

By Jaikumar Vijayan

THE POSSIBLE dismantling of a \$50 million contract between retailer Sears PLC in the U.K. and Andersen Consulting demonstrates why a growing number of corporations are busy negotiating their outsourcing agreements these days.

The case highlights the impact that changes in technology, management and business objectives can have on outsourcing plans.

A Dataquest study this year of 130 corporations showed that 53% of information technology outsourcing deals and 71% of business process outsourcing deals were renegotiated or being renegotiated. Of those, more than 17% were renegotiated less than six months

OUTSOURCING CONTRACTS

By Thomas Hoffman

LET THE BIDDING BEGIN.

Over the next nine years, General Motors Corp. plans to open up nearly \$1 billion in outsourcing deals to Electronic Data Systems Corp. competitors. EDS is an outsourcing unit that was spun off as a separate company last year.

GM's outsourcing strategy is part of a far-reaching overhaul of its information technology environment (see story, page 12).

In fact, Computerworld has learned that GM already has signed its first non-EDS outsourcing contract, a deal that farms out LAN services in the U.K. to Digital Equipment Corp.

The Digital deal, which analysts placed at less than \$50 million, represents a fraction of the \$4 billion GM spends annually with EDS.

But analysts said vendors such as IBM, Digital and Andersen Consulting will try to leverage such smaller contracts into

Not all endorsements require a professional with a \$40 million contract.

No endorsement can make you feel comfortable unless it comes from a credible source. And with one major corporation after another switching to Gateway 2000, that's exactly what you get.

Like you, other corporate IS/IT managers needed business computers specifically designed to meet their needs and exceed their expectations. So that's precisely what we gave them.

For starters, the E-Series desktop line meets manageability head-on with features like stable network-ready platforms, DMI compliance and LANdesk Client Manager. So your company can grow at its own pace.

And no one in the industry can match the degree of modularity offered by Gateway Solo™ portable computers. Now, not only can you switch components individually with one product, you can also switch components across the entire Gateway Solo line.

We also have a full line of servers that are among the

industry leaders in fault-tolerance capabilities. And each server is equipped with components that allow for easy scalability in memory and expansion in network size. So if your company grows from 30 employees to 3,000, now your network can too.

Of course, our full line of workstations can grow with you as well. Each workstation is certified with Microsoft Windows NT and leading application software. And each one features industry-leading graphic power which provides you with uncompromising performance.

The way we see it, when it comes to business computers, we won't stop until we're the leader. So give us a call, and we'll put you in touch with one of our sales representatives. They'll be happy to answer all your questions. Of course, you could also talk to our friends at Union Pacific, Ocean Spray, Hughes Defense Communication...

UP FRONT

The new legacy

An allusion. A tired legacy. A big, expensive, overly complex computing platform that no longer inspires innovation.

Are we talking mainframes here? No, personal computer. As the industry gathers in Las Vegas this week to celebrate all things PC, it confronts what is in effect a midlife identity crisis. The PC industry has settled into the same kind of boredom-and-consolidation phase that hit the mainframe market in the late '80s. Consider the following:

- The hardware business is in an ongoing cycle of buyouts and bankruptcies. Differentiation is based almost solely on price and service. No major new PC maker has hit the scene in 10 years.
- Software talent has deserted the PC platform. The companies that defined the desktop—Lotus, Ashton-Tate, Borland, WordPerfect—are either out of business or into something else. The most innovative new software companies—Netscape, Yahoo, JavaSoft—don't care if you run their products on a PC or a mainframe.

The PC industry is confronting a mid-life identity crisis.

left of interest in the desktop.

• The idea of downsizing mainframes to networks of PCs—a so popular fad of five years ago—turned out to be dumb. The client/server concept is under attack as performance and manageability problems overwhelm hardware cost savings.

To those who remember the cockiness of the early PC pioneers, this turn of events is ironic. The PC industry has staged into lethargy while the big-system concept has staged somewhat of a comeback.

Comdex attendees may note that the computer industry is moving beyond the PC, whose limitations are becoming all too clear.

Morphing the PC model

Shifts in PC buying patterns, such as the move to direct sales, are evident from interviews with experienced PC buyers. They told us what really matters to them is how well their vendors know them, whether a vendor can deliver dozens of identically configured PCs and the fine balance between price and support.

Buyer's Guide,
page 101

NT Workstation luring users

By Laura Di Dio

A random polling of 15 managers indicates that Windows NT Workstation migration is heating up, thanks to declining hardware costs and a big push by Microsoft Corp. to ease the upgrade path.

Although the move to the 32-bit Windows NT Workstation platform is accelerating, it won't displace Windows 95 as the dominant operating system for at least four years, analysts and Microsoft executives said.

Still, NT Workstation's superior security (see related story, page 28) and automated management capabilities are combining with a robust Zero Administration Kit and support for a wider array of software drivers to make NT Workstation more attractive as a mainstream operating system.

OS LEAPING

In interviews last week with 13 Fortune 1,000 corporations, information systems managers attributed growing interest in NT Workstation to the rapid dissipation of traditional hindrances, such as the decline in RAM, storage and overall PC costs.

Although 80% of companies still use 16-bit applications that run on Windows 95 and legacy Windows 3.1 and DOS operating systems, half the corporate users interviewed plan to skip Windows 95 entirely.

"Chances are very good that we'll bypass Windows 95 and go directly to Windows NT Workstation," said Keith Thibodeaux,

a network manager at United Companies Lending Corp. in Baton Rouge, La. "We did a cost comparison between Windows 95 and [NT Workstation] a couple of months ago. The price of memory is no longer a factor: 32M bytes of RAM is now about \$79," Thibodeaux said.

Users cited more robust security and management capabilities as the most compelling reasons to leapfrog Windows 95 or 98 in favor of Windows NT Workstation.

"The Zero Administration ef-

forts are crucial, and Microsoft is putting a lot more energy into [NT Workstation] management. With Windows 95, instead of Zero Admin, we have 100% administration," Thibodeaux said.

Martin McAdam, general manager of international sales and marketing at An Post, the Irish national Postal Service in Dublin, said it decided a year ago to skip Windows 95. "[NT Workstation] is more robust and C++-certified for security. Windows 95 has no security to speak of," McAdam said. He added

NT migration, page 199

Trade shows have the edge

Comdex Snapshot

It's show time

The top five shows or industry events

Note: 234 respondents; multiple responses allowed

Source: Comdex/Network/Interop Survey

More than ever, users are looking to trade shows for information about IT, despite tight budgets and cheaper options, such as searching the World Wide Web.

An exclusive Comdex-sponsored survey of 109 information systems employees found that 64% are attending the same number of trade shows as last year, but 27% said they are attending even more shows and conferences.

Users also said their budgets for such travel and training are slowly creeping up. But respondents were split on whether regional or national shows provide more bang for the buck.

A whopping 75% said the availability of fast data from the Internet hasn't altered their plans to attend trade shows.

Exchange 5.5 consolidates servers

By Barb Cole Gombosi

USERS MOVING to Microsoft Corp.'s Exchange 5.5 are touting the program's ability to ease administration by consolidating electronic-mail servers.

Slated for release this week at Comdex/Fall '97, the upgrade also lifts the 16G-byte limit on server storage, which made it hard to support more than 500 end users per server, users said. Now, Exchange sites can boost the scalability of their servers up to a few thousand per server by adding more disk

capacity, users said.

The upgrade also has improved Internet hooks. Specifically, it supports the Lightweight Directory Access Protocol for accessing directory information over the Internet and the Internet Message Access Protocol, which gives users more flexibility in the way they access their E-mail.

"Fewer servers means lower cost of ownership," said Marion Weiler, senior messaging technologist at Chevron Information Technology Co. in San Ramon, Calif. (see related story,

page 93). The oil company has about 27,000 Exchange sites. To date, it has been able to run as many as 700 users per server, but the average has been about 500 users per server, Weiler said.

In addition to fewer boxes to manage, users said eliminating servers would streamline software upgrades and make it easier to manage the entire messaging network from a central point.

Analysts were skeptical, however, that simply reducing the

Exchange, page 129

OS, application support trail NT clustering systems

By Jitkumar Vijayan

SECOND-TIER VENDORS are taking the lead when it comes to delivering Windows NT systems that scale to eight processors.

But user response is likely to be muted for the moment because of lingering questions about NT's ability to scale past four processors.

"Part of the appeal of [technologies] like these is it gives users the assurance that they have the headroom to grow if they wanted to," said James Garden, an analyst at Technology Business Research, Inc. in Hampton, N.H.

But few are likely to make the move to eight-way systems until full-fledged operating system and application support is available, he added.

EIGHT-WAY ANNOUNCEMENTS

This week, Data General Corp. and NCR Corp. will both unveil eight-way symmetrical multi-processor systems based on Intel Corp.'s Pentium Pro chip and running Windows NT.

DG's Avision 8600 supports up to eight 300-MHz Pentium Pro chips, up to 8M bytes of memory and starts at about \$55,000 for an eight-way system. NCR's 4380 server supports up to 80 bytes of memory, up to 10GB bytes of storage and starts at \$60,000 for an eight-way system.

The announcements put both companies among the forerunners in the race to bring new scalable technologies to the NT market. Market leaders such as Compaq Computer Corp. and Hewlett-Packard Co. are also working on delivering similar capabilities—but neither has a product out yet.

"One of the main reasons we like it is the ability to go eight-way if we need to scale up our application," said Russ Price, manager of networks and telecommunications at H&R Block in Kansas City, Mo. □

Cabletron tools to aid warehouse monitoring

By Patrick Dryden

SEEKING TO EXPEND network troubleshooting beyond fault management, Cabletron Systems, Inc. and nearly a dozen other vendors this week will launch network-oriented data warehouse software designed with service levels in mind.

"We need this to build troubleshooting expertise that won't walk out the door and to establish credibility with our users," said Cabletron user Bryan Ruhf, manager of the consolidated

network operation center that now controls services for 20 agencies of the state of Michigan in Lansing.

Unlike the proprietary "knowledge base" for Spectrum, Cabletron's distributed network manager, the storehouse adheres to open standards for databases. More users could benefit from Spectrum Data Warehouse, which begins beta testing now and is expected to ship next quarter.

The storehouse takes raw statistics from Spectrum and diverse monitoring sources and cleans and presents information to data mining and reporting tools. Cabletron and partners such as Optimal Networks Corp. in Palo Alto, Calif., will provide tools tailored for tracking network performance and usage.

Ruhf said he needs to store details about the state's networks and responses to problems. That will help new hires get up to speed faster, which Ruhf said is necessary because operators often take their experience to the higher-paying private sector.

Because the agencies are asking him "to prove what the network is doing and if we're living up to our promises," Spectrum Data Warehouse will provide a report card, Ruhf said. Because the data is accessible through a standard interface, the agencies can "use whatever tool they want to extract information and make sure we're not blowing smoke at them," he said. □

Clarification

A comment by Oracle Corp. President Ray Lane in an Oct. 6 interview was edited and could be misinterpreted. Lane's full comment was: "Our sales force is kind of like Willie Sutton: They get where the money is. If you want to make your quota, you sell big database deals or big applications deals. Tools are not a big deal."

Corrections

Because of a production error, the Nov. 10 stock tables were for the wrong date. The information should be ignored.

Due to a reporting error in the article "SGI results worse than expected: McCracken out, layoffs planned," [CW, Nov. 3], a paragraph incorrectly stated that SGI acquired Cray Computer Corp. SGI acquired Cray Research, Inc.

Sun pushes application consolidation

► Move to big servers could mean big savings

By Jalikumar Vijayan

SUN MICROSYSTEMS, INC. this week will launch a program designed to help corporations consolidate applications spread across many Unix systems onto fewer big Sun servers.

The program was designed to appeal to a growing number of organizations to slash hardware and management costs by aggregating and centralizing their distributed servers.

Under the Server Consolidation Program, Sun representatives will visit a client's site, assess how servers and applica-

tions could be consolidated, start a pilot project, then roll out a more broad-based consolidation later. The program also provides for ongoing asset management to track server utilization.

SAVING MONEY

"Consolidating to large platform forms can lead to dramatically reduced costs in acquisition, support and management," said John Webster, an analyst at The Yankee Group in Boston.

Terry Cieslak, chief technology officer at May & Speh in Downers Grove, Ill., estimates that his company will save about

half a million dollars in the next five years through server consolidation.

The company, which provides database and information management services to corporations, is replacing three six-processor Hewlett-Packard Co. Unix enterprise servers with one of Sun's highest-end Sparc servers.

"Everything can now be managed from a single console. . . . The connectivity is a lot better; you can share peripherals, technical people find it easier to support a single machine, and the performance is also better," Cieslak said.

Consolidating servers also

makes it easier to perform tasks such as tape backup, as well as providing adequate disaster recovery and security, said David Krauthamer, MIS manager at Parker Hannifin Corp. in Robert Park, Calif.

"The proliferation of servers in the enterprise is causing a management and security nightmare. Consolidation is one way to bring a semblance of control," he said.

Sun is leading its consolidation charge with its high-end Ultra Enterprise 20000 servers, which can support up to 32 processors. The systems can be internally partitioned into as many as eight separate systems, each with four or more processors. In theory, that will let users run applications from eight servers inside the same Sun box while dedicating the same number of processors to each.

Other vendors, including HP, IBM and Digital Equipment Corp., offer similar scalability and availability on single systems, analysts said.

All those vendors are targeting the consolidation market with such hardware, but so far none has in place a formal program such as the one

Sun is announcing.

IBM is developing a program around server consolidation that is to be announced next year.

That isn't stopping Kemper National Insurance Co. in Chicago, which recently consolidated multiple IBM RS/6000s into an IBM SP parallel processing system.

"We saw a rapid expansion of the number of RS/6000 systems we were going to need," said Dennis Dunlap, Kemper's manager of MVS/Unix system software. "The timing was good to install an SP and take a LAN to the car" approach for its current needs and future data warehouse, he said. □

Senior Editor Tim Ouellette contributed to this story.

Nader confab airs monopolistic gripes; Microsoft calls event 'kangaroo court'

By Carol Sliva
WASHINGTON

EMPOWERED industry luminaries gathered at a Ralph Nader-sponsored conference here last week to air concerns that Microsoft Corp. will transform its grip on the software industry into control of the Internet.

Charging that the Redmond, Wash.-based software giant freezes out and intimidates competitors, the roster of high-profile speakers who attended the "Appraising Microsoft and Its Global Strategy" conference accused the company of hampering consumers' right to choose.

For example, Scott McNealy, CEO at rival Sun Microsystems, Inc., said Microsoft effectively locks in customers by making it impossible for competitors to discover the secretly created, arcane details in its software code that can cause a computer to crash if altered even slightly.

"Do we want all the great engineers in Redmond driving the Web technologies, or do we want all the great engineers on the planet driving?" McNealy asked.

In his summary remarks, consumer advocate Ralph Nader said, "The company's monopolistic tactics close off alternative technological paths, limit inno-

vation and assure that consumers will pay monopoly rents to Microsoft." He also said Microsoft's "rapid amalgamation of economic power translates into a disturbing concentration of political power."

Antitrust attorney Gary Reback, who has represented several companies pushing to have Microsoft investigated for monopolistic activity, went a step further. He said Microsoft wants to "extend its monopoly" to Internet content through exclusive deals with providers, as well as control the access points through its forays into broadcast television, cable and Internet-enabled devices.

"Microsoft is using the same old tricks to try to close the only real portal that we have to the Internet: the desktop," Reback said.

NO-SHOW

Notably absent, Microsoft rebutted its invitation to what it called a "kangaroo court." It instead had employees respond with company position papers while a small group of supporters handed out buttons that proclaimed "Ralph Nader doesn't speak for ME!"

The five-page missive from Microsoft Executive Vice President Robert Herbold called it "regrettable" that Nader's group

aligned itself "with a small band of Microsoft's detractors, whose apparent goal is to enlist the government's assistance in their efforts to compete with Microsoft."

A typed response from Nader described the conference as "a genuine attempt to facilitate debate about how the information economy should be constructed."

"I'm really amazed by Microsoft more than angered," Nader said. "Its techniques are almost sophomoric. Here are these tough, super-rich, aggressive, dominant guys, and they're backing away. If their arguments are so compelling, why don't they want to engage?"

The consumer activist said he intends to stay involved in the issue "until it reaches a self-driven momentum." Nader said the likely next step will be more detailed presentations of breakout topics at seminars and over cable television.

"There needs in the future to be more specific investigation of Microsoft practices. Together, we must begin a serious discussion of specific courses of action and remedies for the various problems identified at the conference," Nader said.

A panel of software developers and other NT suppliers and trainers also held a news conference in defense of Microsoft, claiming it encourages rather than stifles innovation. □

Playing the GAME

Microsoft, a Capitol Hill no-show as recently as 1990, is now a legitimate Beltway player. And not for nothing: Recent laws and rulings stand to save the company millions and to facilitate its embrace of the globe — and points beyond. But you've got to watch your back in Washington; Microsoft's enemies have hired guns of their own. This week, we listen as Microsoft raises its lobbying voice.

THE QUANTITY and quality of support for Tivoli Management Environment (TME) 10, which earlier this year came under fire from some users, has improved, as promised, users said.

But Tivoli still is having trouble finding and training TME experts, and users say support hasn't improved as much as Tivoli claims.

But enterprise users may get more support as the result of a business partnering program Tivoli Systems, Inc. launched last week at its second annual developers conference at corporate headquarters here.

Tivoli also is rustling up systems integrators, service providers and value-added resellers to create a broad support infrastructure by the middle of next year to move TME 10 software to small and midsized businesses, said Frank Moss, Tivoli's CEO.

The IBM management software division is fighting Computer Associates International, Inc. for the lead in the systems management market, which

Support has been a stumbling block, however.

In May, Moss said support demands by key enterprise users forced Tivoli to postpone the rollout of a simpler form of

TME to. That package will comprise the basic framework plus five or six applications, such as system monitoring, inventory and software distribution.

Support for enterprise users began to catch up in June and is

How Tivoli is improving support for TME 10 management software

adequate now, "180 degrees different today from the beginning of the year," Moss said.

"It's not fixed yet," said Don Whitfield, a vice president at NationsBank Corp. "Tivoli won't get there until all the people hired this year get experience."

Deployment of TME 10 to hundreds of the bank's Novell, Inc. NetWare servers is on hold until someone figures out how to stop Tivoli's NetWare Loadable Module from crashing the servers when it unloads, he said.

Finding someone with broad knowledge "to deal with quirks that pop up on so many different platforms" is difficult, Whitfield said. "We must be realistic about what's possible, but we had better see some significant results from these changes in six months."

The support situation "hasn't improved as much as Tivoli would like you to believe," said Ray Paquet, a research director at Gartner Group, Inc. in Stamford, Conn. "Our clients tell us they still face a serious support and service issue," he said.

Longtime Tivoli users such as Delmarva Power & Light Co. suffered "horrendous" support after IBM acquired Tivoli, said Blaine Boyles, a project systems programmer at the utility in Newark, Del.

Response improved greatly over the summer, Boyles said. Now he gets reasonable answers within two days by sending electronic mail to bypass first-level support and referrals, he said. □

Will The Year 2000 Have Any Impact On Your Environment?

Choose the wrong vendor and it could sink your entire enterprise.

At Computer Associates, we've leveraged over two decades of experience in building tools for applications development, maintenance, and migration to create an award-winning solution for your year 2000 problems.

CA 2000™

CA Discovery 2000™ provides the only end-to-end solution for all aspects of your compliance effort, including analysis, fixing, testing, and life cycle management. Our

CA-Fix/2000™ tool automatically fixes COBOL code, one application at a time. It's the only tool with intelligent data flow analysis providing the high speed, high volume fix for year 2000, that you need today.

Behind our CA Discovery 2000 solution stands a Professional Services

team that is experienced in all aspects of year 2000 compliance. After all, as the world's leading independent software company, we have more experience re-engineering legacy applications than anybody. And with a 21-year track record of success and over \$4 billion in revenue, our clients know we'll be around long after the year 2000.

Preparing your application for the next century may be the most important job you've ever faced. Start now and turn the biggest challenge of your career into a triumph.

KNOWLEDGE MANAGEMENT

Users loathe to share their know-how

By Barb Cole-Gomelski

SHARING KNOWLEDGE is apparently a skill that many of us don't practice in the workplace.

New research and interviews with IS managers who have deployed specialized groupware, called knowledge management, show that employees' desire to hoard their own know-how is the biggest hurdle companies face in deploying these collaborative applications.

The idea behind knowledge management is to stockpile workers' knowledge and make it accessible to others via a searchable application. Such applications can help companies make better business decisions and improve customer service.

"People are always the problem," said Jeff Held, a partner in the center for technology enablement at Ernst & Young LLP in Vienna, Va. Ernst & Young has a knowledge management application built on its Lotus

Development Corp. Notes network. "You can talk about the benefits of knowledge manage-

ment until you're blue, but workers won't buy into it unless it benefits them," Held said.

And it can be hard to clearly explain the benefits of knowledge management to end users, several information systems managers said. In the absence of evidence that it is worth their time, workers will resist the application.

"We have come from an organizational environment in which knowledge is power, hoarded and welded for private gain," said Hadley Reynolds, a research director at Delphi Group, Inc. in Boston. A survey released earlier this month by Delphi showed that corporate culture was cited by 53% of respondents as being the biggest obstacle to deploying knowledge management applications.

"We don't share very nicely, and I don't really know what to do about it," said an IS manager at a large oil company who watched a knowledge manage-

ment application built on Notes lose favor with workers after the mainstream of the application left the company.

John McFadden, senior vice president of information and technology at The Chase Man-

sold more products and services. User support was strong because they were heavily involved in the development of the application, McFadden said. Account managers also had a clear understanding of how the application would enable them to more effectively do their jobs, he said.

Keeping the application simple seems to help, too. Held said that Ernst & Young's skills data

How to get employees behind knowledge management:

- ▶ Make the business benefit of the knowledge management application clear
- ▶ Reward workers who contribute their knowledge
- ▶ Create a corporate culture in which workers are encouraged to share information
- ▶ Ensure that the knowledge management application is user-friendly
- ▶ Involve users in design of application

hattan Bank Corp. in New York, spearheaded a successful knowledge management application designed to help account managers deliver better service to customers, which meant they

base — a precursor to the current knowledge management system — became outdated because workers refused to fill out an exhaustive array of electronic forms. □

Planning blunts Web traffic spikes

By Sharon Machlis

WHETHER THE CAUSES are plunging stock prices, a hot murder trial or the death of a prince, information systems executives who oversee popular World Wide Web sites are grappling with how to handle huge spikes in Internet traffic.

It is, they say, one of the "problems" that come with success. "I love hearing about too much traffic," said Chris Stevens, an analyst at Aberdeen Group, Inc. in Boston. "If there's no traffic, that suggests the Inter-

net is the CB radio of the '90s."

Web sites can add servers, boost bandwidth and spread the load by mirroring sites, depending on where bottlenecks arise.

At Court TV, where traffic hit an all-time high during the Louise Woodward murder trial in Massachusetts, information technology executives first calculated how much traffic the site could handle. "We had never asked that question before," said Rob Golden, senior vice presi-

dent of business development at the cable network in New York.

The company discovered it had twice the capacity of a previous peak load, but it arranged with its Internet service provider to temporarily double that server capacity.

"I wasn't even sure if that would be enough," Golden said. But although there were some delays in page loading times, the site stayed up, he said.

Time, Inc.'s Pathfinder site got its first taste of a surfer flood two years ago when the 1995 Sports Illustrated swimsuit issue was released.

"It's huge for us," said Vicki Zilaitis, director of technology at Time, Inc. New Media in New York. To handle that and a massive traffic increase during the O. J. Simpson murder trial, site architects realized they needed extra bandwidth, stand-

by server capacity and a more modular approach to manage the occasional onslaught.

Today Time hooks up backup servers, usually used for beta testing, as well as a backup Ty line for high-volume days such as when the swimsuit issue surfaces on newstands.

"You're going to have to over-engineer," said Fred McClimans, CEO at consulting firm Current Analytics, Inc. in Ster-

Prudy servers in the rescue

Financial sites that can't afford to have regional Internet exchanges bring them down can pay to have connections to two different backbones.

But during last month's one-day 7% stock market drop, few brokerage could offer instant access for their customers by Internet — or by telephone, for that matter.

MSNBC stayed up to provide stock quotes for users in part by mirroring its site on the Fp, said John Nicol, director of technology at MSNBC on the Internet.

Members at the site constantly check server performance. When Wall Street prices started to tank, those members "started going red on us," he said.

The IS team responded first by setting up a proxy server, which sent out its own queries for updated stock-price information, and then returned that data to individual users. That reduced traffic compared with each user making a separate query out for the data, and it immediately boosted performance 20%.

Later, MSNBC resorted to site so that people logging on to the marketplace Web pages with stock quotes weren't making real-time information requests for the latest prices. Instead, users who wanted the most current financials were directed to a single, market-watch page. — Sharon Machlis

Time's Vicki Zilaitis taps backup servers to handle more hits

Strategies for handling heavy Web peaks

- Use modular architecture to easily add servers
- Add mirror sites in multiple locations
- Consider technologies such as frame relay that can increase network performance
- Off-peak Web site download proxy servers at Web caching
- Negotiate with Internet provider for flexible server capacity

Oracle8 Database Messaging Massacres Microsoft Exchange

FRANKLY SPEAKING

Sun's thumb on the scale

FRANK HAYES

WHAT WOULD Sun Microsystems think about on a Java benchmark?

To get a jump on its rivals? To convince customers it has the best Java? To take a cheap shot at Microsoft?

Nipe. Turns out it was, um, a public service. Sure, that's it—a public service designed to help make even better benchmarks. Sun is just, eh, highlighting the weaknesses of the benchmark test it got caught cheating on. And with Sun's continued, uh, help, those benchmarks will just keep getting better.

That, believe it or not, is Sun's latest official story as to why it jerry-rigged a test system to give blowout results on CaffeineMark, a Java benchmark developed by a suburban Chicago consulting outfit called Pendragon Software Corp.

The explanation might be a little more

credible if Sun's SunSoft division had started out with that story four years ago. Back then, SunSoft claimed its version of Java for Solaris 2.6, Sun's version of Unix, ran 50% faster than Java on Windows NT. The proof? CaffeineMark results that showed a score 50 times higher than NT's.

Then, when Pendragon's

Why would SunSoft cheat on a Java benchmark?

own benchmark engineers proved that the Solaris Java beta had been rigged to blitz through the CaffeineMark logic test. SunSoft managers denied there was any CaffeineMark-specific optimization.

When Pendragon's people found 600 bytes of their benchmark's code in the

Solaris Java beta, SunSoft managers still denied it—and said Microsoft had put Pendragon up to claiming SunSoft had cheated.

A week ago last Friday, the true truth came out: SunSoft was just demonstrating a weakness of the CaffeineMark for the good of the industry.

At least that's what Larry Weber, the SunSoft division's general manager, told me. He also said it wasn't really SunSoft that created the CaffeineMark-cheating code. That was the work of Sun's chip group, he said.

SunSoft, by my count, has at least four different stories on why it did what it did. But so far, nobody has been able to tell me what I really want to know: What possible benefit could there be for customers from SunSoft's cheating on a Java benchmark?

I admit I'm not a fan of benchmarks, especially the publicly available kind. I don't trust them. They don't accurately reflect what corporate IS shops use products for.

They're hard to develop, and they're easy to cheat.

But every benchmark is built on a very good idea: that IS product decisions should be based on requirements and testing, not just marketing hype and popularity.

Trouble is, that's exactly what vendors of popular products with a lot of marketing hype don't want. So they cheat on the benchmarks. Sometimes it's just a matter of tweaking. Occasionally, it's the kind of clumsy fakery that SunSoft built in to its Solaris Java beta.

Either way, it's a lie—and a colossal waste of time and effort.

Then again, maybe it does offer some customer value after all. Maybe it tells us what a vendor thinks is really important to deliver to customers.

And apparently, SunSoft believes the biggest benefit it can deliver is a rigged demo.

IRS update: Maybe the tide has turned on the Internal Revenue Service's efforts to go rooting through source code ("Frankly Speaking," Oct. 6).

The new tax bill passed by the U.S. House of Representatives earlier this month makes it harder for the IRS to get source code, but it still lets the agency go after it if the IRS can prove there's no other way to perform an accurate audit. The Senate will take up the bill next year. □

SHORTS

Aging software

At the Year 2000 Conference and Exhibition this week in Boston, Princeton Software, Inc. in Princeton, N.J., will introduce Age 2000, a tool designed to add "date aging" data to files so users can test their year 2000 files. The system, which will begin shipping in January, starts at \$40,000 and works with IBM MVS files.

IBM updates OS/390

With Version 2, Release 4 of the OS/390 mainframe operating system out the door, IBM is prepping Version 3, Release 5 for delivery next March. The new version includes solid TCP/IP support and improved support for mainframe clustering. It also adds more security to the built-in Internet firewall and supports IBM's Component Broker middleware to run object-oriented software on mainframes, IBM officials said.

HP buys NT management tool

Hewlett-Packard Co. last week acquired NetView, Inc. in Houston. The start-up's software can centrally manage multiple servers or workstations running Windows NT. HP will sell the tool, ManageIt, as part of its OpenView line and form a new business unit to help customers manage NT-based systems and applications.

'net to overhaul procurement

Internet-based purchasing will "overhaul inefficient corporate procurement practices," according to a study by Forrester Research, Inc. in Cambridge, Mass. By 1999, Internet auctions and requests for proposals will drive a second wave of Internet purchasing, the study concludes. One other Internet Users will migrate their electronic data interchange systems to Internet alternatives.

Sharp ships handheld line

Sharp Electronics Co. this week launched Mobilon, a line of handheld PCs that uses Microsoft Corp.'s Windows CE 2.0 operating system. The handhelds feature a color screen, a digital camera card option, an audio record feature for memos, a Web browser and a built-in 33.6K/56K bit/sec. modem. The Mobilon HC-4000, HC-4100 and HC-4200 cost \$599, \$699 and \$990, respectively.

SAP aligns with SAS Institute

Data warehousing vendors continue to line up outside the doors of SAP R/3 users. The latest is SAS Institute, Inc. in Cary, N.C., which this week is expected to announce plans to more tightly integrate its data warehousing and analysis products with SAP AG's business applications. Meanwhile, Palo Alto, Calif.-based Hewlett-Packard Co. in early December plans to detail enhanced support for warehousing SAP data as part of its OpenWarehouse suite.

Informix to restate financials

Informix Software, Inc. in Menlo Park, Calif., this week will finally restate its financial results dating back to 1995 and reveal a product repackaging aimed at simplifying its software lineup [CW, Dec. 13]. Robert Finocchio Jr., who took over as CEO of the beleaguered database vendor in July, is scheduled to meet with financial analysts in New York on Tuesday to discuss both issues.

56K flight

Rockwell International Corp.'s Semiconductor Systems division has sued Ray Networks, Inc. in federal court in Los Angeles, claiming that unspecified actions by the Santa Clara, Calif.-based internetworking vendor violat-

ed its license for Rockwell's 8x56K modem technology. Bay Networks, which also licenses competing 56K bit/sec. technology from 3Com Corp., says it is "100% in compliance" with its license.

Mainframe-to-Java

Computer Network Technology Corp. in Minneapolis next month plans to unveil a new Web-to-host package called Cool 3270. It will turn mainframe-based 3270 data streams into Java output that can be read by any Java browser. Pricing for Cool 3270 wasn't available.

Notes antivirus tool ships

Symantec Corp. in Cupertino, Calif., recently shipped a beta version of its forthcoming Norton AntiVirus for Lotus Notes, a new antivirus package that scans messages and attachments in real time to find viruses and macro viruses in Microsoft Word and Excel documents. It runs on all Lotus Notes 4.5 servers using Windows NT 3.51 or 4.0. The software will ship next month for \$795 per server in a 25-user version.

Single intranet sign-on

Platinum Technology, Inc. in Oakbrook Terrace, Ill., this week will announce a version of its AutoSecure Single Sign-On software and the beta release of Web Security Management for providing single sign-on to intranets. Pricing for AutoSecure starts at \$195 per user. Web Security Management is due in the first quarter next year.

SHORT TAKES As expected, AT&T named Alan G. Jones as its chief information officer, replacing Ben Ponder, who is leaving to become president and CEO of Bechtel World Data Systems, Inc. in Clark, N.J. [CW, Nov. 10]. Jones, 51, had been CIO of AT&T's business and consumer markets.

Oracle to ship spiffed-up Developer/2000

► Development tool upgrade promises less manual coding

By Craig Siedman

AFTER MORE THAN a year of beta testing and strategy shifts, Oracle Corp. this week finally plans to ship a less-ostentatious version of its flagship development tool.

Developer/2000, which builds applications for Oracle databases, is getting spiffed up with expanded drag-and-drop capabilities, object features and other enhancements that are supposed to reduce the manual coding users need to do.

Those are welcome changes for shops that have had to pay through the nose to hire experienced Oracle developers or to give neophyte users crash courses on the database kingpin's proprietary PL/SQL programming language.

Oracle shops cut salary and training costs, Heinrichs-Wolpert added. Oracle developers with PL/SQL skills can command salaries from \$50,000 to \$100,000, or

more, he said.

Developer/2000 2.0 went into beta testing in September 1996 and was originally due early this year. But Redwood Shores, Calif.-based Oracle put it on hold so it could rush out a pair of interim ve-

leases that let users build thin-client applications that mix World Wide Web browsers and application servers.

The new version of Developer/2000 includes automated development wizards and supports point-and-click building of database schemas and SQL queries, Oracle officials said. The tool also is taking some initial steps into the world of object technology and code reuse (see chart). Prices start at \$5,995 per user. □

WHAT'S NEW IN DEVELOPER/2000

- Expanded set of point-and-click builders
- Wizard technology for automating development
- Object library for storing reusable components
- Unified debugger for three-tier applications
- Simplified reporting and charting capabilities

"Customers have been telling Oracle that we need a way to use the product more efficiently, and now they've listened to us," said Donna McConnell, an Oracle tools specialist at Detroit Edison Co. She also is a director of the International Oracle Users Group—Americas.

PL/SQL coding may not go away completely, but Version 2.0 of Developer/2000 should make it easier to build and modify applications, McConnell said.

Detroit Edison is testing the new release and plans to use it after a companion upgrade of Oracle's Designer/2000 database modeler comes out early next year, she added.

Echidna Systems Corp., a systems integrator in Victoria, B.C., is using the beta-test version of Developer/2000 2.0 to build and update geographical data applications for the British Columbia Ministry of Environment, Lands and Parks.

Developer/2000 "has always been a pretty decent product, but it's been hard for first-time users or casual coders to learn," said Thor Heinrichs-Wolpert, a consultant and senior technical architect at Echidna. "Now you can get someone who isn't a guru in the tool to build applications for you."

Reducing the need for big teams of experienced PL/SQL coders could help Or-

Tests show I4M's performance and space savings far superior compared to VSAM with hardware-supported SSAs.

Sun walks a fine line on Java standards

By Sharon Gaudin

WITH SUN MICROSYSTEMS, Inc. poised to lead the charge to set Java standards, users want assurance that Java's biggest supporter doesn't try to become Java's dictator.

Members of the International Standards Organization (ISO), the global body that oversees high-tech industry standards, are collecting the final vote on Sun's request to be the official submitter for Java. At press time, Sun was one vote short of the needed simple majority.

Sun's bid has drawn fire, especially from its highly vocal rival, Microsoft Corp., because it veers from the usual process of having a consortium of vendors and users act as the official overseer of a standards process.

Because Sun has a large stake in mak-

ing money off Java, critics contend that if the ISO vote is successful, Sun would have far too much control over what is supposed to be an open process.

Dave Spenhoff, director of product marketing at Sun's JavaSoft division, agreed that Sun will be under tight scrutiny. But he said the company is considering some changes based on comments some countries made during the voting process. For example, he said Sun is considering making test suites for Java virtual machines — which are now part of Sun's licensing product — openly available to developers.

That news comes after reports that Sun has been high-handed with some of its major platform developers, allegedly holding the test suite to force developers to turn over their source code for testing.

To Sun — a company that builds and sells its own virtual machine.

"We have to test [virtual machines]," said George Paolini, JavaSoft's director of marketing. "We have to make sure every [virtual machine] is compatible so Java will run equally on all the platforms."

Corporate developers using the various Java tools don't have to license anything from Sun. And a third party does all the testing for 100% Pure Java applications.

"We're moving to Java because it's an open environment, so we hope it stays that way," said Verna Muckle, director of MIS at the criminal division of the U.S. Department of Justice. Muckle's division is piloting Sun's JavaStation network computer.

The criminal division is not at all invested in something solely owned by one company. "While we're piloting, I'm going to watch them, sure. We're going to make sure Java stays open, that [Sun] keep its promises," she said.

"We've been looking at ways to make the process somewhat more open," said Jim Mitchell, vice president of technology and architecture at JavaSoft. "People lose sight that that's why we've been going through this process." Mitchell said Sun is considering giving licensees a vote on any specifications being developed.

That is the kind of thing users and other software vendors will be watching, said Evan Quinn, an analyst at International Data Corp. in San Francisco.

"Sun's getting awarded the big prize," Quinn said. "Sun's got to act carefully. Everybody's going to be watching. If they start leaning over this platform, people will back off and maybe even look to [Microsoft]." So far, the U.S. is the only member country, out of 27, to vote against Sun's request. Much of the backlash against Sun was led by Microsoft, which joined the ISO process for the first time soon before the vote and has been accused of trying to derail Java. □

The challenge of a lifetime

► **Szygenda's mission:**
Rebuild IS at GM

By Julia King
DETROIT

JUST IMAGINE building a fully functional city from the ground up, and you begin to get some idea of Ralph Szygenda's mission as General Motors Corp.'s chief information officer.

Szygenda was hired in June 1996 from Bell Atlantic Corp. His mandates are to slash GM's \$4 billion annual information systems budget "by hundreds of millions over the next five years," implement common systems across GM's highly autonomous and somewhat recalcitrant business units, adopt an integrated design and engineering system that will have near-cycle time; and, perhaps most important, build an IS leadership infrastructure where none existed before.

Why would anyone want this job?

"I think it's the challenge and the visibility of the challenge," said George Heilmeyer, chairman and CEO of Bellcore, one of Bell Atlantic's biggest technology suppliers. Heilmeyer is now on GM's six-member technology and scientific advisory committee.

"Let's face it. Most good people like to be No. 1. Ralph is no exception," he said.

"The challenge of starting over from scratch was so overwhelming. It was too much to turn down," said Szygenda, 49, a self-described workaholic who usually puts in 12-hour days at his downtown Detroit office before hitting the treadmill for an

evening workout.

"Plus," he said, "it's kind of hard to turn down the world's largest company."

Szygenda is the mastermind behind GM's ongoing transition to a technologically self-sufficient organization.

Until its 1996 spin-off from GM, Electronic Data Systems Corp. handled virtually all of GM's IS requirements, including strategy and planning.

In his first 18 months on the job, Szygenda has focused heavily on building what he calls an IS leadership infrastructure.

So far, he has hired 35 CIOs for GM's business units and another 100 or so process and technology implementation executives.

Those information technology staffers work in GM's business units, but their job is to drive common processes across

the company. They also act as consultants to business unit CIOs.

With much of the hiring behind him, Szygenda has refocused on technology and implementation. Next year, he said, "it's a big execution year. We have determined strategies for every part of the business, and we know where we want to go."

"I have people totally dedicated to each other. So as I chose people, I had to look for people to learn," Szygenda said of the hiring process.

TECHNOLOGY FOCUS

But don't get the wrong idea. Szygenda, a mechanical engineer by training, isn't a New Age, touchy-feely CIO who emphasizes people skills over hard-core knowledge of technology.

"He's very focused on the technology," said one longtime IS executive who interviewed for, but didn't land, one of GM's 35 CIO slots. During the interview, the executive said, Szygenda "talked about setting up architectures and picking emerging technologies. I got the impression that Ralph will end up with the largest local area networks and largest wide-area networks and more PCs than anyone else," he said.

"Ralph plays on both sides. He knows the technology of the business, but he also knows business. That's what makes Ralph unique," Heilmeyer said.

As a Bellcore customer, Szygenda was "tough but fair," he added. "Ralph is a sophisticated customer. He knows what

things should cost, how they should take and how difficult they should be."

GM's three-year-to-do list includes implementing off-the-shelf enterprise software across all of GM's finance and human resources operations.

NEW INITIATIVES

Also in the works is a conversion to fully integrated, math-based vehicle development systems. Those systems will enable thousands of GM designers and engineers worldwide to jointly create and test new cars in a completely virtual environment. The idea is to eliminate the time-consuming development and modifications of wood and clay models.

GM also has a big data ware-

house initiative under way.

It is calling customer preference and usage information from on-board systems in some GM cars and from its network of more than 8,500 dealerships, which have been linked via an electronic network known as GM Access.

"We're moving from designing a vehicle and hoping a customer will buy it to sensing what a customer wants," Szygenda said.

Taken together, "these are all monstrous changes for GM," especially when you consider the three-year implementation period, Szygenda said. "And we might miss some of them, but I'd rather start off with an aggressive schedule to change the company." □

GM revamps its outsourcing

CONTINUED FROM COVER 1

a front-runner position with GM after the EDS agreement expires in 2006. "Now that other outsourcing vendors know what contracts EDS holds, they're going to do whatever they can to win that business," said Lisa

Mao Ross, an analyst at International Data Corp. in Framingham, Mass.

The beneficiary, of course, is GM. The automaker not only is trying to save money by operating these contracts to competitive bidding, but it also is looking to improve quality, boost service and enhance its technology wherever possible, said Bob

Chaffin, GM's director of information systems finance. "Nothing determines competitiveness like the market on a daily basis," he said.

ROOM TO IMPROVE

Chaffin said that beginning next year, about \$230 million worth of information technology services will be on the table. Under the EDS contract, mainframe processing and U.S. telecommunications are off limits, but "everything else is being actively considered," he said.

Chaffin emphasized that GM isn't dissatisfied with EDS. But competing offerings from best-in-class service vendors can help a colossus such as GM become a more efficient company.

"Our job is to never be satis-

fied, to always look for improvement," Chaffin said.

Analysts said GM is generally pleased with EDS's performance.

But EDS supplies such a broad range of services—everything from help desk to telecommunications support—that there are bound to be "pockets" of dissatisfied customers. And competing vendors will try to exploit those areas, said George

Logemann, an analyst at The Yankee Group in Boston. Under the contract, GM can auction off areas where it is either dissatisfied with EDS, looking for more expertise or seeking lower costs.

Chaffin wouldn't tip his hand as to which operations GM is considering. But he said the company is looking at off-loading pieces of its IT infrastructure and application development.

"We'll probably come up with \$500 million to \$600 million worth of candidates from which we'll choose a few hundred million dollars [worth of business] this year," Chaffin said.

GM last month began issuing requests for proposals for next year's contracts. Although Chaffin declined to identify functional areas up for bid, he confirmed that "there are some [requests for proposals] out there" now. □

GM will run financials on R/3 cylinders

GM has decided to make use of German engineering.

General Motors last week announced its plans to standardize on SAP AG's R/3 software to run its global financial operations. GM previously had used SAP human resources modules at its Opel plant in Germany and its AC Delco facility in France.

Terms of the deal weren't disclosed.

The move is part of an ongoing effort by GM to cut costs by standardizing on common platforms. The system is expected to help GM reduce its financial operating expenses by deploying common processes throughout its global operations, said Cheri Messer, business services information officer at GM.

GM will begin a phased rollout of the software starting with its automotive assembly and component businesses in Europe and Asia, followed by operations in North America and South America. The new system should be fully deployed by 2001.

—Thomas Hoffman

"Psst ... Wanna Buy Some Time?"

You Need SoftFactory/2000

There's more than one way to buy time – but you gotta know the secret. Word on the street is that SoftFactory/2000™ with SmartFind/2000™ is the only way to go if you are going to get your Y2K projects completed quickly.

The SoftFactory/2000 solution is technology-based, requiring less manpower compared to other approaches which are primarily manpower-driven supported by a little technology.

SoftFactory/2000 is so fast and so accurate, it's like buying time between now and the year 2000. That's because SoftFactory/2000 is the only Y2K solution which uses SmartFind, an intelligent problem-solving technology that filters your code to identify only true date fields and only the date occurrences that need to be fixed.

Compare that to other approaches which rely primarily on slow and expensive manpower...assuming you can find qualified people in the first place.

Time is running short, but we can get you to compliance before the year 2000. Call us at 1-800-632-6265 today.

Corporations keep close eye on outsourcing pacts

CONTINUED FROM COVER I

after they were first signed. In the case of Sears, an information system certification effort started by former CEO Liam Strong was reversed by the board following Strong's departure in April, according to a news report from International Data Group's IDG News Service. (IDG is Computerworld's parent company.)

The U.K. office of Andersen Consulting last week said it was re-examining its contract with Sears — no relation to Sears, Roebuck and Co. in the U.S. "The contract cannot stay the same because the synergies of scale present in the original contract are no longer there," said one Andersen source in the U.K. Sears officials didn't return phone calls.

BREAKING UP IS HARD TO DO

"Changes like these can render original contracts totally invalid," which leads to expensive terminations of deals, said Susan Scrupski, an analyst at Technology & Business Integrators, Inc. in Woodcliff Lake, N.J.

Such moves come as a handful of high-profile failures have begun to highlight the challenges corporations face in making larger outsourcing and integration deals work.

For example, earlier this year a 10-year, \$250 million outsourcing deal between Mutual of New York and Computer Sciences Corp. fell apart. The reason: disagreements about the scope and scale of the services to be provided by a joint venture formed by the two companies. Similarly, an ambitious 1995, 50-year agreement between Delta Airlines and AT&T Corp. failed with the breakup of AT&T last year.

Restructuring contracts through renegotiation is one way of pre-empting such conclusions, analysts said.

"Almost 50% of my practice right now deals with formal renegotiations leading to major restructuring of outsourcing agreements," said Dan Mummery, a lawyer at Millbank,

Tweed, Hadley & McCloy in New York. The law firm specializes in IT outsourcing deals.

"Renegotiation mostly is a positive thing — to make deals work better," said Alice Young, an analyst at Dataquest in Westboro, Mass. Consider Farmland Industries, Inc., a \$5.5 billion farmers cooperative in Kansas City, Mo. It recently set up a joint venture called OneSystem Group with Ernst & Young LLC to provide IT services back to Farmland.

Six months into the deal, the companies restructured the arrangement to include another vendor, Systems Management Specialists, to handle data center operations for OneSystem.

The move will save Farmland \$14 million to \$15 million during the next five years in labor and infrastructure costs, said Kent Nunn, chief information officer at Farmland.

"Obviously, there is a tremendous amount of change involved with some of these arrangements," Nunn said.

"For them to work, you need to have a great deal of trust in the relationship you have with your vendor" and have top-level management buy-in, Nunn said. For example, Farmland's deal with Ernst involves both companies keeping an "open book" on each other's financial affairs.

UNSPECIFIED EXPECTATIONS

The biggest challenge in making outsourcing relationships work "has to do with unspecified expectations that customers and vendors have when getting into outsourcing arrangements," said Benue Campbell, CIO at Sonoco Products Co., a \$2.8 billion packaging company in Hartsville, N.C.

Concerns such as those drove Sonoco to add a 400-page document that listed exact business objectives, technology goals, terms and conditions to a 10-page desktop outsourcing agreement it recently signed with Enx Information Services in Rye Brook, N.Y. □

Transaction action

► MasterCard nixes X.25 network in time for holiday shopping season

By Thomas Hoffman

THOSE LONG holiday shopping lines could move a little faster this season, thanks to a new transaction processing network being rolled out by MasterCard International, Inc.

The upgrade of MasterCard's Banknet from an X.25 network to a virtual private network based on frame-relay technology is expected to cut transaction processing times in half.

The Purchase, N.Y., credit-card giant has extended the network to member banks and merchants in the U.S., Canada and Singapore. It already is han-

dling nearly 70% of MasterCard's total transaction volume.

That will be critical to MasterCard and its partners during the holiday shopping season, when point-of-sale transaction volumes typically peak at 40% above normal periods.

With its old 56K bit/sec. X.25 network, MasterCard would typically have to upgrade hardware to handle the additional volumes from Thanksgiving to Christmas and then underutilize the hardware for the next three quarters.

Now, using AT&T Corp.'s

frame-relay services, MasterCard can order increased bandwidth for 35 to 40 days and then "size it back down" after the holidays, said Arthur Ahrens, senior vice president of operations services at MasterCard in St. Louis.

"Even if I didn't [use the upgrade] was a smart thing to do because it gave me flexibility," Ahrens said.

By utilizing frame relay and Asynchronous Transfer Mode technologies from AT&T and its international partner, the network permits MasterCard to create virtual private network "paths" for its members.

Ahrens declined to quantify the project investment or anticipated cost savings. Octavio Mariani, director of research at Meridian Research, Inc. in Needham, Mass., placed MasterCard's AT&T bill at "hundreds of millions of dollars" annually.

The network will be extended to Latin America, Asia-Pacific, the Middle East and Africa by the end of next year.

SET DEVELOPMENTS

- IBM and Verifone to work on product interoperability
- Developer's guide to be released by these vendors by next June
- SET backers to develop new compliance testing program

Vendors address SET product compatibility

By Sharon Machin

JUST BECAUSE two products both meet Secure Electronic Transaction (SET) specifications doesn't mean they will actually work together.

That concern over potential product incompatibility could mean yet another holdup in SET's adoption, which is under development by major financial firms including Visa International, Inc. and MasterCard International, Inc., as a way to safely conduct credit-card transactions on the Internet.

"The biggest barrier to mass adoption of SET is interoperability," said Ann Culver, product manager at CompuServe Network Services in San Francisco.

GUIDELINES

In response, IBM and Hewlett-Packard Co. subsidiary Verifone, Inc. last week said they launched a program to ensure that their products properly communicate with each other

The companies also will publish a developer's interoperability guide by June.

Although SET lays out a technical framework, there are different ways of implementing a financial-transaction business model.

For example, one product could collect more information about a transaction than another: when they attempt to exchange information, the second product might not know how to handle the extra data.

"If your wallet doesn't talk to somebody else's merchant server... you can't do anything," Culver said. Under SET, consumers would use an "electronic" wallet when making purchases on the World Wide Web.

David Marshart, an electronic-commerce specialist at Patricia Seybold Group in Boston, said he was encouraged that two major vendors decided to work together on compatibility, instead of vying to create their own versions of the standard. □

NET MIX

MasterCard's competitors currently use hybrid networks. Visa International, Inc. in San Mateo, Calif., uses a blend of X.25 and frame relay. American Express Corp. in New York mixes those technologies with point-to-point leased-line connections.

MasterCard's shift away from a capital-intensive network to a virtual network is the wave of the future, analysts said.

Catalog firms and retailers that historically did the bulk of their sales during the holiday period used to "rent" additional hardware to handle the extra transaction processing volumes, said Frank Dzubek, president of Communication Network Architects in Washington.

Those upgrades are no longer needed now that bandwidth can be upgraded and downgraded when needed, Dzubek said. "The old world was physical: the new world is virtual," he said.

And by having AT&T manage the network, MasterCard will be able to reduce its administrative costs.

Under the X.25 environment, MasterCard had to manage relationships with more than 50 carriers. □

Farmland's Kent Nunn: Outsourcing pacts require a great deal of trust in the vendor

"We're Forté for the Web!"

Many companies are saying, "We're just like Forté, only for the Web." What they mean is that they're targeting scalable, reliable, mission-critical applications for the Web. Trouble is, they're talking futures. Meanwhile, Forté customers have *already* developed and deployed robust, component-based Web applications today. Customers like Eli Lilly, HOME Account Network, Mazda, TransCanada Pipelines, Banco do Boston and World Bank, to name just a few. So if you really want Forté power on the Web, the only place to get it is ... from Forté.

[Click here to see what industry analysts say about Forté](#) or to view our latest [Web White Paper](#). Better yet, sign up for the next [Forté seminar](#) in a city near you. Or call 800-622-5076, today.

Because only Forté has what you need to develop enterprise Internet applications, today.

YOUR
IS OVER

IBM move will give users better handle on network computers

By April Jacobs

OBSERVERS SAY IBM's decision to open up its network computer management software to competitors could be a boon to users who want to manage multiple platforms under a single umbrella.

For example, Mike Prince, chief information officer at Burlington Coat Factory Warehouse, Inc. in Burlington, N.J., said he doesn't have an overall management platform for his 350 network computers but will need one if the company moves ahead with plans to put about 1,300 more network computers at its retail locations nationwide.

Prince uses network computers from Network Systems, Inc., formerly HDS Network Systems, in King of Prussia, Pa.

"Our ability to manage our [network computers] as we scale up will be more of an issue. We would welcome good management software, especially if the IBM pack does a good job," Prince said.

IBM's offering would be a breath of fresh air, observers said, because the market is devoid of comprehensive management packages. Software such as Computer Associates International, Inc.'s Unicenter works

with Sun Microsystems, Inc.'s JavaStation, but there is no wide-scale software in the network computer market that compares with software such as Hewlett-Packard Co.'s OpenView.

IBM offers a product called Network Station Manager free of charge with its Network Stations. The management software lets network administrators construct a user's privileges on the server as well as manage all user applications from the server. That cuts down on service calls and maintenance. The server-centric network computers require little troubleshooting because of their simplicity.

PARTNERING UP

Network Station Manager will be renamed Network Client Manager in its new format. An IBM spokesman said. IBM plans to partner with other network computer vendors to develop application programming interfaces for the software to work with multiple hardware platforms. Network Station Manager now runs on the AS/400, Windows NT servers and the RS/6000.

One of the first vendors to step forward to join IBM is Noveware, which is working with

IBM to allow Network Client Manager to manage its NeoStation 300 and its upcoming NeoStation 200, which will be announced at Comdex/Fall '97.

IBM's server management software will give network computer users better tools to manage hardware and software under a single umbrella, said Noveware Executive Vice President Michael Kautowski. Vendor tools now manage only their own network computers.

Jane Wright, an analyst at Meta Group, Inc. in Stamford, Conn., said no other vendor has stepped forward with a server-based management tool to manage multiple platforms for network computers.

"The market is very open to this right now because server management tools in the [network computer] are even more important than the PC environment because users are so dependent on the server to function," she explained. □

Comdex/Fall '97 attendees will be seeking ways to manage network computers running Java on multiple platforms

Handhelds feature bigger screens

By Kim Girard

A NEW GENERATION of better handhelds running Microsoft Corp.'s Windows CE 2.0 operating system will be featured at Comdex/Fall '97 this week in Las Vegas.

Hewlett-Packard Co., NEC Corp., and Casio Computer Co. are among the vendors expected this week to unveil machines that feature bigger screens and keyboards.

Those devices are expected to compete at the low end of the mininotebook market, but users and analysts say that is still a couple of years away.

"Eventually, this class of device will represent a large volume of notebooks sold," said Rob Enderle, an analyst at Giga Information Group, a Cambridge, Mass., consultancy.

But Enderle said vendors must first improve display and storage capabilities.

Indeed, many companies aren't ready to take the plunge.

"As a department, we're not supporting them in any way, shape or form," said Gary

Coombs, systems manager at Scientific Atlanta, Inc. in Norcross, Ga., which has more than 5,000 employees and uses Dell Computer Corp. laptops.

"They've got a lot of work to do to get user acceptance," said Stanley Dobrowski, supervisor of data processing operations at Bergen County Utilities Authority in Little Ferry, N.J.

The HP 620LX features full-size output for PowerPoint

Dobrowski said he will stick with his DOS-based HP handheld for now because programming is much simpler than with a Windows CE device. And hanging a larger CE device off his belt would be inconvenient, he said.

One user said he is awaiting an upgrade to Window CE 2.0

but is frustrated by the lack of applications for his HP 320LX.

"One of my pet peeves, where Microsoft needs to get on the stick, is to be more aggressive with software applications," said Robert Kreitzer, president of Enterprise Marketing Solutions, a consultancy in Washington Township, N.J., and a member of the New York HP Handheld Users Group.

The lure for users is that the CE devices can handle electronic mail, scheduling and simple document making. They also can be used to synchronize with desktop programs, including Microsoft's Outlook, Word and Excel.

And the latest models, with their color screens and faster processors, are expected to rival Intel Corp.-based mininotebooks — such as Toshiba America Information Systems, Inc.'s Libretto — in performance, but at a much cheaper price.

The HP 620LX costs less than \$2,000, features 16M bytes of RAM, a full-color display and full-size output for PowerPoint presentations. □

Primary sources of IT information

Spotlight shines on speech recognition

By Gordon Mah Ung

IF 1997 IS THE YEAR of World Wide Web-enabled software, 1998 will be the year of speech-recognition-enabled software, some industry observers said.

Everything from electronic-mail clients to browsers now feature or will feature some form of speech recognition in the upcoming year. Voice recognition and text-to-speech systems are expected to be one of the highlighted technologies at this week's Comdex/Fall '97 show in Las Vegas.

But are advances in speech-to-text and continuous speech recognition dictation likely to become ubiquitous on corporate desktops anytime soon?

Probably not, industry observers said. With half of corporate desktops still running Windows 3.x and 16-bit applications, the horsepower just isn't there for everybody.

"My guess is when [large corporations] have the hardware to do Windows 98 or NT, that they will then be in a position to use voice if they want to," said Amy Wohl, editor of the computer industry newsletter "TrendsLetter" in Nürberth, Pa. Wohl is preparing to release a white paper on speech recognition systems.

Minimum requirement of most continuous speech products: A 166-MHz Pentium with 32M bytes of RAM. Analysts believe 50% of corporate desktops still have only enough power to run Microsoft Windows 3.1.

Corporations already are adding the infrastructure. International Data Corp. in Framingham, Mass., said the average machine being purchased by companies now has a 200-MHz Intel Corp. Pentium MMX with 32M bytes of RAM.

"I wouldn't be surprised in two years if we don't use it to supplement things in transcriptions," said Arich Hennemen, manager of computer services at Valley Care Health Systems in Livermore, Calif. Hennemen said the company considers voice recognition systems almost every year. The technology itself has matured much in five years. "We haven't bitten yet, but we're keeping an eye out," he said.

Betting on voice, Lotus Development Corp. in Cambridge, Mass., recently bundled parent company IBM's ViaVoice with Lotus SmartSuite 97 and integrated it with the suite's word processor, WordPro 97.

Lotus is considering extending the voice capabilities to other areas, including letting users control the computer by voice, not just dictate into the word pro-

cessor, said Penny Scharfman, a Lotus senior marketing manager. Continuous speech recognition has sparked interest in the suite, she said.

Microsoft Corp. also isn't taking voice lightly. In September, Microsoft CEO Bill Gates announced the company had invested \$45 million to buy an 18% stake

in Lernhout & Hauspie Speech Products. Microsoft is hard at work on natural language processing, an important component of voice recognition.

And a spokeswoman at Corel Corp. said the Ottawa company is looking at ways to embed speech technology in its WordPerfect Office suite. □

There Are A Million The Unicenter TNG

Unicenter TNG Is The Industry Standard For Network And Systems Management.

When you develop for Unicenter® TNG™, you're writing for one of the most popular and productive platforms in the industry. Unicenter® has been publicly endorsed by virtually every major hardware and software company, including Microsoft, Sun, SAP, Intel, HP, DIGITAL, Tandem, NCR, Fujitsu, Data General, Cisco, Sequent, SGI, SCO, and Unisys.

Who Can Enter?

Whether you are an employee of an ISV, a CA Business Partner, or CA client, or a consultant working from

your home—in other words, no matter who you are (except CA employees and their families of course), you're welcome to enter.

\$1,000,000 In Cash Prizes!

Imagine winning hundreds of thousands of dollars in cash—simply for doing what you love! Here's a rare chance to show off your developer skills while taking a shot at the largest cash award jackpot the industry has ever seen.

If you win, not only will you take home a very large cash award, you'll also earn industry-wide recognition as one of the best developers around.

The Unic A C H I E V E M

It's Quick And Easy To Develop Winning Unicenter TNG Solutions.

The Unicenter® TNG™ Framework™ can save you years of development time. It provides an instant foundation for virtually any kind of application you need to develop, complete with the common services your applications need.

When you enter the Unicenter TNG Developer Contest, you can request a free Unicenter TNG Framework CD and a free Unicenter TNG Software Development Kit (SDK). Use them to develop your winning entry! No software purchase is required. Of course, if you are already a Unicenter TNG client, you can develop your entry with the product.

**COMPUTER®
ASSOCIATES**
Software superior by design.

Reasons To Enter Developer Contest.

1. Best Use of Unicenter TNG
2. Best IT Intelligent Agent
3. Best Non-Computing Agent
4. Best Application Agent Development
5. Best Network Device Agent Development
6. Best Security Agent Development for Network
7. Most Effective Use of Unicenter TNG
8. Most Socially Responsive Application of Unicenter TNG
9. Most Creative Application of Unicenter TNG
10. Greatest Competitive Advantage Derived by Implementing Unicenter TNG

GRAND PRIZE WINNER

One Million
Dollars In
Total Cash
Prizes!

enter TNG ENTAWARDS

**Enter As Often As You Like In
One Or All Ten Categories.**

Take a look at the ten Unicenter TNG Development categories and you'll be sure to find one that's perfect for you. Are you a security expert? An Internet addict? A specialist in intelligent agents? Here's an opportunity to cash in on all of your expertise and professional experience. Turn your career knowledge into cash.

Or perhaps you have a new idea that's totally outside of what you do 9-5. Maybe it's something you've always wanted to write. Something very different than your traditional IT applications. Or even something that makes the world a little bit better place. No matter what kind of application or agent you want to create, this contest gives you a chance to do what you do best—and get paid handsomely for it!

**Gold, Silver And Bronze
Winners Will Be Chosen
For Each Category.**

That gives you three chances to win in every category!

A distinguished group of industry experts will judge all entries and choose the winners. The Grand Prize Winner with the best application overall will receive a prize of \$100,000 cash at CA-World 1998 in New Orleans. The contest deadline is March 16.

Database makers slow to move objects

By Craig Stedman

MAJOR DATABASE vendors aren't exactly putting the pedal to the metal to deliver promised object technology.

Nearly five months after shipping its Oracle8 database, Oracle Corp. is just

starting to beta-test development tools that are supposed to make it less painful for users to take advantage of the software's built-in object capabilities.

Meanwhile, Computer Associates International, Inc. delayed shipments of its new Jasmine object database for a third

time after the product flunked quality tests last month, officials confirmed.

And Informix Software, Inc. is still fine-tuning a Windows NT version of its object-enabled Universal Server database that was originally due out in June (see box).

The slow progress doesn't appear to be causing widespread headaches, because most mainstream applications still are centered on relational databases.

But some database users want to start getting their feet wet with objects.

For example, Jim Scott, financial applications manager at Comcast Cable Communications, Inc. in Philadelphia, said he is trying to get a test copy of Oracle's Object Database Designer tool for Oracle8 so he can begin experimenting with the technology.

OBJECT SHOWDOWN

Vendor	Product
Oracle	Oracle8 object modeling tool due in Q1 1998
CA	Jasmine object database delayed until December
Informix	Universal Server database for Windows NT to ship by year's end

HOWE IT THAT TINY MAGNETIC PARTICLES CAN BE POWERFUL ENOUGH TO ATTRACT AN ENTIRE INDUSTRY?

The magnetic particles in our ATOMM technology are only 0.1 micron thin, but that doesn't mean their pull on the storage industry isn't felt far and wide. In fact, Iomega's Zip™ drive and Quantum's DLT™ 4000 and 7000 tape drives were designed specifically to take advantage of it.

ATOMM (Advanced super Thin-layer and high-Output Metal Media) is a unique dual-coating system we developed that gives our storage products superior capacities, faster transfer rates and greater reliability. Take our new HFD™ floppy disk. It's the same size as a regular floppy disk, but it stores 200 MB and still delivers a 3.6 MB/sec transfer rate. That's the type of improvement we're talking about. You'll find similar advances in our other products.

Our super thin-layer ATOMM technology led to some of today's most popular drives.

Zip disk

DLT tape

HFD 3.5" 200 MB disk

Our DLTape™ IV offers an ATOMM driven 70 GB capacity. If you want another example of ATOMM's strength try our 125 meter 4mm cartridges. After all, they offer triple the capacity of previous cartridges. If there's any doubt left about what a difference ATOMM can make, just consider our Zip disks — the first product to utilize the technology. They were able to change the way whole industries store data. So don't let the tiny particles fool you. If there's one thing ATOMM technology backs up best, it's the theory that good things come in small packages. Call 1-800-488-FUJII for more information or visit our Web site at www.fujifilm.com.

WHERE THE FUTURE'S STORED

The ability to turn business processes into reusable software objects could make application development much faster, especially as Comcast converts client/server systems to the World Wide Web, Scott said.

But "cranking out a bunch of SQL code" to create database objects isn't very appealing, he added.

For now, users who want to build Oracle8 objects have to do hard labor to manually write SQL and C++ code, conceded officials at Oracle in Redwood Shores, Calif.

Object Database Designer, which is due early next year, will change that by providing a visual modeling tool with a built-in C++ generator, an object repository and support for converting relational data designs to object form.

BABY STEPS

But Oracle is still just "taking some baby steps" toward full object support, said Anthony Bradley, an analyst at Meta Group, Inc. in Stamford, Conn. Object Database Designer doesn't link up with business process modelers and application tools, and even Oracle8 itself has limited object capabilities, he said.

CA, in Isla Vista, N.Y., is now targeting December for the release of Jasmine.

The software, a pure object database aimed at multimedia and World Wide Web applications, has shipped a full year behind CA's original shipment date of late 1996.

"If it got delayed too much longer, that could set back some implementation schedules for us," said Dave Nahmias, manager of product marketing at Template Software, Inc., a Dulles, Va., vendor that plans to use Jasmine in object applications it designs for customers.

But Jasmine's programming environment is solid, which lets application development proceed, Nahmias said.

Jasmine should speed up development and application performance compared with mapping objects into relational databases, he said. □

THE MARINES. THE GREEN BERETS. THE NAVY SEALS.

Welcome to reseller boot camp: The Sun Competency Certification Program—a proving ground from which

a handful of value-added resellers will graduate. Trained in Sun® products, consulting and interoperability,

as well as the latest Java™ technologies, they're certified in everything from

Enterprise, Workgroup and Specialty categories to service and support. Simply

put, they're the ones the tabloids call when the big MIS scandal breaks. Sure, there are easier ways to

become a reseller. There are also bargain parachutes. The bottom line is that when you see the Sun seal

of approval hanging on the wall, your rip cord worries will evaporate like software titles for the Commodore 64.

Just look for the certification logo, and walk on in. Left-left-left-right-left. THE NETWORK IS THE COMPUTER™

NOW LET'S TALK ABOUT A PROGRAM THAT'S TOUGH TO GET INTO.

RDBMS had a good run.

Your relational database once ran well, but now you frequently encounter the demons of technological obsolescence. However, relief is in sight. You can now develop transactional applications without the limitations of relational technology. With Caché, the post-relational database, from InterSystems. Caché provides the performance and scalability needed for complex transaction processing. Unlike "object-relational" products that layer objects onto a relational database engine, Caché incorporates a lightning-fast transactional/multidimensional data model and advanced object technology. In addition, even in backward compatibility mode with SQL for legacy applications, Caché achieves a several-fold improvement in performance and scalability. Now is the time for Caché, the post-relational database, available for GUI and Web-based applications on Windows 95 and NT, OpenVMS, and major UNIX platforms. Call us at (617) 621-0600, or visit our website at www.intersys.com.

Post-Relational Database.
New Dimensions of Transactional Performance.

Your hardware should work harder.

80% of PCs shipping today have 32 megs of RAM or more.

So if you're like most companies, your standard-issue PC—the one you'd put on the desk of any new employee—is plenty capable of running Microsoft® Windows NT® Workstation.

It would, in fact, perform better.

It would be more reliable.

More secure.

And faster.

Just so long as it's running Windows NT Workstation.

So, is it?

Windows NT Workstation fits into your existing environment and works with the standard applications and peripherals you already have.

So it's easy to see why Windows NT Workstation has become the compelling choice for every new desktop in your organization.

To evaluate your current mix, visit us online.

It's time for that standard-issue PC to start living up to its potential.

NT SECURITY

Administrators hold the key

► Users find NT security to be strong, but implementation can be tricky

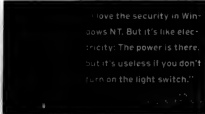

By Laura DiDio

EVEN THOUGH Microsoft Corp.'s baseline security architecture in Windows NT is considered to be inherently strong, it is only as good as the administrators who secure a network.

Implementation can be a challenge for inexperienced administrators, but poor planning and user errors still account for many network security breaches, said users and security specialists.

"I love the security in Windows NT. But it's like electricity. The power is there, but it's useless if you don't turn on the light switch," said Deag Johnson, senior technical specialist at Freudenberg-NOK, General Partnership in Bristol, N.H. "You have to know what you're doing. Windows NT has a lot of depth, and we don't know enough yet about all of its internal quirks to make it bulletproof, so we brought in outside consultants to help out."

Sentiments such as that are good news for Microsoft, which increasingly needs to move users off 16-bit platforms to the 32-bit NT, while also wooing en-

terprise users. For example, Microsoft CEO Bill Gates will team up with Digital Equipment Corp.'s Robert Palmer at a Dec. 4 press conference on NT and the enterprise.

GOOD REVIEWS

Overall, one dozen Fortune 1,000 businesses and three security analysts said NT security compares favorably with competing operating systems such as Unix, Novell, IBM's IntranetWare and IBM's OS/2 Warp Server. No operating system offers the near impenetrable level of security of mainframe operating systems such as IBM's MVS, they said.

Despite potential potholes, there isn't a smoking gun that will singularly take down a Windows NT network, the users said. Internet Security Systems, Inc.'s (ISS) Net/Xforce in Atlanta—which ferrets out and publicizes security holes and fixes for a variety of operating systems—so far this year has uncovered 17 Windows NT security issues that it rated as highly vulnerable.

"That's pretty low," said David LeBlanc, ISS's senior Windows NT security engineer. "We get a daily flood of Unix holes."

In fact, said Jerold Damsch, president of JSI, Inc. in Alpharetta, Ga.—with the proper policies, you can lock down Windows NT tight as a drum. "JSI is a reseller that also has a World Wide Web page devoted to the latest Windows NT hacks and solutions www.jsi.com. Still, users said they must constantly dodge potential lethal bullets that are being fired by a more active Windows NT hacker community that wants to invade their networks via a variety of known and as-yet unknown security holes.

The biggest downside to NT

security, users said, is its vulnerability across a wide-area network. "So far, we've managed to avoid taking a major direct security hit. But we don't use Windows NT Internet Information Server (IIS), which is a big entry point for hackers," said Kurt Guerrero, a senior LAN architect at Northern Trust Co. in Chicago.

But at some shops, the potential for remote access hacker invasions is a constant threat.

Jeff Dazell, LAN network security administrator at Dana Corp. in Toledo, Ohio, which has 45,000 Windows NT users, said he is concerned that a remote user will inadvertently wreak havoc on his NT networks because of the well-publicized gaps in Microsoft's Internet Explorer 4.0 and IIS.

"My worst nightmare is that a user will install an unauthorized modem on his desktop or home PC and configure it for remote access. That opens a back door in Windows NT and lets hackers circumvent my proxy server and firewall security as effectively as the Germans sidestepped France's supposedly impenetrable Maginot Line in World War II," Dazell said.

TOO EASY

Paradoxically, one of Windows NT's greatest strengths—its ease of use and installation—is also one of its greatest security drawbacks.

"Windows NT comes out of the box in a completely trusting and open manner. The onus is on the network administrator to enable the security mechanisms," said John Pescatore, a principal at Trustpilot Information Systems, Inc. in Rockville, Md.

Rollin' the hatchets

Organize often "victimless intrusions" by falling in close the most obvious openings in Windows NT, said Jim Marshall, an information delivery security consultant at The Dow Chemical Co. in Midland, Mich. He advised his fellow users to do the following:

- "Disable the Guest account immediately."
- "Remove the Administrator account."
- "Allow administrative access by local log-on only."
- "Remove the 'Everyone' group from directories."
- "Teach users what makes a good password."
- "Store files in a secure directory, even on publicly shared drives such as public directories."

—Laura DiDio

On the plus side, the Access Control Lists in Windows NT are "very good and the fundamental security structure is very strong and flexible," LeBlanc said.

Shulman actively checks and tests each confirmed security bug as it is discovered by legitimate organizations. Once these companies notify Microsoft, the Redmond, Wash., company usually posts a hot fix on its Web site within 24 to 72 hours, said Karan Khanna, a Microsoft security product manager.

LeBlanc said there are no silver bullets that provide 100% security on Windows NT or any network operating system. "Windows NT security is only as good as the person administering it. My best advice is get educated and stay informed," he said. □

Product manager says best defense is common sense

By Laura DiDio

THERE IS NO such thing as a 100% secure operating system environment—but you can come close.

Common sense is one of the best weapons in the security war, said Karan Khanna, a Microsoft Corp. security product manager who offered the following tips for NT users:

- Install the latest service packs and hot fixes on sensitive machines (domain controllers).
- Review and follow the recommendations in "Guidelines for Securing Windows NT" (www.microsoft.com/security/).
- Enforce a strong password policy in your domain using the passfilt.dll dynamic link library.
- Ensure that you have an appropriate level of physical security. For example, restrict the boot process by disabling a

floppy disk boot or by using a power-on password.

- Periodically do "outside-in" network penetration testing. Keep an eye out for open ports, unneeded processes and default account/passwords.
- Turn on auditing for sensitive resources and files, and review audit logs regularly to identify and flag abnormal patterns.

- Business with very high security needs should consider using add-on hardware devices such as Security Dynamics, Inc.'s SecureID cards or Sony Corp.'s FIU FIS-003 security log-on for NT, which authenticates fingerprints.
- Put restrictive access control on sensitive resources—for example, registry keys.
- Use a Windows NT System Startup Key to strongly encrypt on-disk and backup copies of passwords. □

A recent survey shows that nearly 50% of businesses experienced attacks on their networks within the past year. The survey also shows the following:

- 41% had losses of more than \$500,000 for each intrusion
- 35% had losses that cost more than \$1 million per security attack
- 58% said their networks were hacked by outsiders
- 61% said their networks were hacked by company insiders
- 27% doubted their organizations had the ability to detect illicit hacks

SO, YOU WERE WAITING
UNTIL 1998 TO UPGRADE TO
WINDOWS NT® WORKSTATION?

The new HP Vectra VL
WITH MICROSOFT® WINDOWS NT WORKSTATION.
IT'S THE FASTEST HP VECTRA PC EVER.

HAPPY NEW YEAR

THE NEW HP VECTRA VL PC

300 MHz Pentium II processor that
features MMX™ technology

32MB or 64MB RAM

4GB or 64GB hard drive

Windows NT® 4.0 Workstation

10/100BT LAN

Available in minitower or desktop

Corporate volume price starting
at \$2,383*

The best way to take full advantage of the new HP Vectra VL with the
300 MHz Intel® Pentium® II processor is with Windows NT. The Vectra VL
and Windows NT make one of the fastest, most reliable, most manageable
and most secure PC desktop solutions you can provide for your workers.

For more information, go to www.hp.com/go/vectra

MCI/WorldCom megamerger poses challenge to AT&T

► Lower costs, more bandwidth key to users

By Matt Hamblen

USERS EXPECT last week's \$37 billion merger agreement between MCI Communications Corp. and WorldCom, Inc. to result in a strong competitor to AT&T Corp. for voice and data services.

"It's great for a new dog to

stand up on his hind legs and spit in the eye of the giant," said Jack Reed, a systems engineer at Grumman Systems Support Corp. in Longmont, Colo.

Reed said he uses Sprint Corp. in Kansas City, Mo., and AT&T in Basking Ridge, N.J. for services. And although he has no major complaints, he said he was glad to hear that another powerful player could be bidding for his business.

"I'm in favor of competition,

WorldCom's Bernard Ebbers (left) becomes CEO of the new company, and MCI's Bert Roberts becomes chairman

and the merger mania should increase that," Reed said. "You can get too much market power just like IBM once did or now like Microsoft."

Other users said they want increased bandwidth from carriers at the same — or even lower — costs, and they believe the megamerger could help them.

Also key is one-stop shopping. Users said they want one carrier to provide all services for them.

"I look for a reliable network, and I look for a great price," said Christine Sostack, telecommunications manager at Com-

FAQs: It's WorldCom after all

Q: What are the key terms of the MCI/WorldCom merger?

A: WorldCom will give MCI stockholders \$5 of WorldCom stock for each MCI share, up from \$41.50 announced in October. WorldCom CEO Bernard Ebbers will become CEO of the new company, and MCI Chairman Bert Roberts will become chairman.

Q: What about Midlars GTE Corp. and British Telecommunications PLC?

A: GTE wasn't ready to up its \$40-per-share cash offer. BT will be given \$7.4 billion to dissolve its 50% stake in MCI.

Q: Will the deal get approved?

A: Both companies are confident they will win regulatory and shareholder approval in six to nine months, although legal analysts are more skeptical.

stock, Inc. in New York. "If they can't compete on everything, I'll go elsewhere."

CATCHING ATAT

Analyst Dan Taylor at Aberdeen Group, Inc. in Boston said the combined entity — to be called MCI WorldCom — should have \$50 billion in revenue next year. "That would make them really the closest entity we have known to be able to touch AT&T," which has annual revenue of more than \$50 billion, he said.

"AT&T has really been the

only company that could do everything for you," Taylor said, with a wide range of enterprise applications for local and long-distance connections and network services such as frame relay and Asynchronous Transfer Mode.

Analyst Tom Nolle, president of CIMI Corp. in Voorhees, N.J., predicted that the combined infrastructure could make MCI WorldCom an "Internet powerhouse."

WorldCom is based in Jackson, Miss., and MCI is based in Washington, D.C.

Apple to sell direct with online store; users wary

By Kim Girard and Wylie Wong

APPLE COMPUTERS, INC. tried to boost its business last week by opening an online store and offering users build-to-order computers, but analysts said it may be too late to turn the struggling computer maker around.

"Bottom line: This doesn't save Apple," said Eric Lewis, an analyst at International Data Corp. in Framingham, Mass. "They're doing a lot of the right things, but they're not doing enough yet."

Amid much fanfare, Apple interim CEO Steve Jobs last Monday announced the Apple Store, a strategy to boost Apple sales by selling direct to customers. Apple could use the boost: It now holds about 3.5% of the U.S. PC market, a share that has dramatically slipped from 7.9% in 1995 and 5.5% in 1996, according to International Data Corp. in Framingham, Mass.

But Jobs offered no update on the search for a new Apple CEO. Nor did he discuss the Cupertino, Calif., company's plan to build new computer stores. Zoning in on the Internet computer venture, Jobs took a shot at Dell Computer Corp. CEO Michael Dell, who recently suggested Apple shut down and return money to its shareholders.

"With our new products and new store and our new build-to-order manufacturing, we're coming after you, buddy," Jobs said.

Analysts called Jobs' reaction showmanship and noted that Dell, which sells Windows machines and competes in a completely different market, already makes 15% of its sales online.

PROFIT PERCENTAGE

As of last Tuesday, Apple claimed that there had been 4.4 million hits on its new World Wide Web site (www.store.apple.com) after its first day and \$500,000 in orders after just 12 hours of operation.

"One way this helps [Apple] is able to keep a larger percent of the profit" by eliminating the middleman, said Lisa Yee, a systems manager at San Francisco-based law firm Jones Hall, Hill & White. But Lee said it is unlikely she will buy Apple computers online. She said she buys some software on the Web but buys hardware from a retailer because it is less expensive.

But some users will prefer buying directly from Apple for the comfort factor, despite the fact that resellers can still cut the price of an Apple computer sold online by as much as \$500, analysts said. □

Microsoft strikes back at legal attackers

By Carol Shinn

MICROSOFT CORP. may prefer to see the spotlight fall on its products, but these days the beam has been shining on its legal woes at the state and federal levels.

On the federal side, the U.S. Department of Justice remains hot on Microsoft's trail. The company last week filed a 48-page formal response to the Justice Department's complaint, which charges Microsoft with violating a 1995 court order that bars the software maker from imposing anticompetitive licensing terms on PC makers.

Calling the justice Department's claims "baseless" and its reading of the consent decree "implausible," Microsoft said the complaint is "aimed squarely" at preventing the company from including improved features and functionality in up-

graded versions of Windows 95.

Microsoft's response emphasized not only that the government knew of its plans to integrate Internet technologies with its Windows 95 operating system, but also that the consent decree permits those types of "integrated products."

"The very language that says we're allowed to integrate things in Windows 95 was designed exactly for this type of situation," asserted Microsoft vice president Brad Chase.

TRULY INTEGRATED?

He claimed that the mere shipment of the Internet Explorer browser with Windows 95 is sufficient to meet the "integration" threshold. The justice Department, on the other hand, contends that Explorer isn't truly integrated with Windows 95. It claims that Microsoft separately markets, licenses and dis-

tributes each version of the browser in ways different from any integrated features of its operating system products.

On the state level, at least seven attorneys general — in California, Connecticut, Massachusetts, Minnesota, New York, Oregon and Texas — are investigating Microsoft's business practices.

Texas took an extra step a little over a week ago, filing a lawsuit that charges Microsoft with hindering its antitrust investigation by "improperly" forcing customers and licensees to inform Microsoft before they supply information to state and federal antitrust investigators.

Microsoft claims that other companies employ similar non-disclosure agreements. □

OPINION

Lessons learned "Change is good. You go first," is one of my favorite pieces of Dilbert advice. It also sums up

Computerworld's cautious approach to redesigning our Web site, www.computerworld.com.

Like so many of the companies we cover in our own quest for the ideal Web site, we've watched online trends avidly while debating what our 2-year-old site should become when it grew up. We tinkered with the design and the color schemes. We swapped search engines.

We tossed editorial content onto our home page like designer luggage into a cargo hold. Ultimately, we realized that although there was great stuff in there, it was getting too crowded to find it easily.

All that changes today with the launch of our reorganized and reader-friendly site. We tore it down and rebuilt it to suit readers who click in looking not only for the latest technology news but also for job resources, services and management information tools.

Oddly enough, we learned our best lessons from some highly successful consumer sites rather than from other tech publications with the all-too-familiar editorial kitchen-sink syndrome.

We've streamlined @Computerworld into four easily navigated categories: News & Features, IT Careers, Resource Center and Computerworld, Inc. The News & Features area provides an easier, more organized way to check up on everything from the latest news to audio interviews to thought-provoking opinions from our columnists. The IT Careers section contains all sorts of job-related information, stories and services. The Resource Center includes an archive of skills- and product-related data and research. And the Computerworld, Inc. spot displays our own company data such as subscription information and advertising rates.

So head over to www.computerworld.com and check it out. Let us know if Dilbert was right about change.

IRS abuses guidelines on independent consultants

COMPUTERWORLD's story about the IT labor emergency, though informative, omitted what is probably the single biggest reason for the situation: Section 1706 of the Internal Revenue Code.

For 11 years now, 1706 has been used capriciously by the IRS to stifle independent technology consultants and smaller consulting firms by singling out an entire class of workers for nothing short of harassment and intimidation. The IRS

and more than a few unscrupulous brokers/agents have spread disinformation about the use of independent consultants or small consulting firms, falsely claiming that it is illegal, in some cases, to use them.

The IRS has repeatedly misused and unconsciously applied its "20 questions," which supposedly are used to determine whether a practitioner is indeed an independent consultant or an employee. These tactics have not helped to improve either the number of fully qualified, experienced practitioners nor stimulated business use of the smaller firms that could easily satisfy their development requirements.

In the 16 years my firm has been around, we have managed to stay in there and fight the trend to become a successful consulting

and development firm. However, more than a few of my peers have fallen by the wayside, unable to survive 1706 issues and challenges. If we want a solution to the shortage, then both the client businesses and the practitioners need to lean heavily on Congress and get 1706 repealed.

Perhaps the horrible reality that many companies, both large and small, are confronted with significant disruptions and losses from year 2000 and other infrastructure issues will shock them into action.

European telecom envy

LIKE SO THE Computerworld article on WorldCom and MCI ("WorldCom bid surpasses MCI," CW, Oct. 6), though it would have been neat if the one-year outlook chart had included international telecommunications providers, too.

Many of the U.S. companies listed in the chart don't even serve Europe (yet), so our choices are much more limited. Although some of our telecom companies are huge, too, the market is over-regulated and noncompetitive. I'm looking forward to the day when I have as many telecom and Internet service provider choices here

as I used to have in California.

Nerds grew into suits

FRANK MATYS' column ("Suit or nerd?" CW, Oct. 20) continues to illustrate his complete lack of knowledge of the industry.

Before the introduction of the home-boy PC to the office, with its brigade of self-proclaimed experts, IS was very successfully managed by nerds who grew into suits. They brought with them an in-depth understanding of the tech side and hard-earned stripes in business management. Professionals (in the past) did not turn out bug-ridden software or incompatible systems based on the latest fad.

Double-check your bridge to the year 2000

Gary H. Anthes

When I set out recently to write a story suggesting that the year 2000 problem might not be so terrible after all, a colleague expressed grave doubts.

To him, the problem was so patently horrendous and complex that it would be irresponsible to suggest otherwise, no matter what Polyannas I might find.

After some research — and I did find some Polyannas — I had to conclude he was right: The year 2000 problem is really ugly. But I salvaged the story by adopting a slightly different premise: There are real aligators in the year 2000 swamp, but some organizations, such as the Social Security Administration (SSA), had found ways to bridge the swamp and could now sleep nights.

It wasn't until after the story was printed that I found that bridge had holes.

But my embarrassment pales next to what the SSA must be feeling.

The agency recently discovered 33 million lines of legacy code that had been overlooked in its highly touted year

The SSA discovered 33 million lines of code that had been overlooked in its highly touted year 2000 program.

2000 program. Congressional auditors now say there is substantial risk that some of its mission-critical systems — those that pay out \$386 billion in annual benefits — may not be fixed in time.

What's ironic about this — and so scary about the year 2000 problem — is that the agency for years has been an

icon of year 2000 preparedness. It began work on the problem in 1989 when a program choked on a 21st century date.

While other agencies either writing their hands or just sat on them, the SSA fixed millions of lines of code.

The SSA held year 2000 seminars for other federal agencies, and its IS managers gave speeches on how to survive in a post-1999 world. Whenever the year 2000 came up in public forums, such as congressional hearings, invariably someone would say of the Defense Department or the IRS, "Why can't they be more like Social Security?"

But now the General Accounting Office (GAO) reports that 54 state disability systems were excluded from the SSA's year 2000 work. The SSA had limited its work to its central systems, which include 24,000 software "modules" and 34 million lines of code. The state systems are vital for determining eligibility for federal disability payments. But the SSA began examining them only 11 months ago.

The GAO also revealed that the SSA has no contingency plans in case its systems aren't fixed on time. The SSA said

it hadn't developed them because it felt its early start on the year 2000 problem would make those plans unnecessary. Who needs contingency plans if you're planning on having no contingencies?

And in another Alice-in-Wonderland explanation, it also said it hadn't developed backup plans because it simply had to meet the deadline. In other words, if you aren't allowed to fail, you won't fail. But probably nothing highlights the need for backup plans more than the revelation by the GAO that the SSA exchanges some 6,700 data files with other organizations. Not all of them began year 2000 work in 1989, one suspects.

There are several lessons here. First, starting early and working hard on the year 2000 problem doesn't ensure success. Second, if you have no year 2000 contingency plans, you aren't ready for Jan. 1, 2000.

Third, the devil is in the interfaces. Technically, the overlooked systems are state, not federal systems, but they're vital to the processing of federal payments. If a year 2000 problem hurts your customers, it is your problem. □

Honesty, not IS, failed at HMO

Michael Schrage

No doubt you've read about the disaster Oxford Health Plans ran into phasing in a new billing system.

The system, launched more than a year ago, royally screwed up whom got billed and when. The health maintenance organization was forced to advance hospital payments against their unprocessed invoices. Huge reserves were set aside. Cash flow congealed. The stock cratered. The chief financial officer resigned. The outlook of this high-flying entrepreneurial HMO — which was heralded as a model for the industry — is upturned with doubt.

We can treat this as a cautionary tale of MISmanagement. We can breathe a sigh of relief and mutter, "There but for the grace of God go I."

We can even smirk arrogantly in the belief that a disaster of that magnitude could never happen to us. Each of those responses qualifies as rational. But my reaction to this debacle is emphatically not rational.

Each story I read left me furious and incredulous. Mind you, I haven't a penny invested in Oxford, and I haven't called

up my friends who work with HMOs.

The intensity of my feelings reflects my most deeply held position about the real sickness that plagues enterprise management — its fear of responsibility. I don't doubt for a moment that Oxford's switch-over to this new system was hideously mismanaged.

Maybe Oxford's was the worst IS team since Grace Hopper coined the word "bug."

But, please! Just where the heck was top management during that year of living dangerously? Just how deaf, dumb and blind were the people running this company?

When did Oxford's board of directors, which is legally responsible to exercise fiduciary oversight, first know that the company's new billing system was creating more problems than it was solving?

No doubt, we're going to find out the explicit answers to these questions — not a few delivered

under oath. Let me tell you what those answers will have in common: dishonesty.

No, the answers themselves won't necessarily be dishonest — although I wouldn't bet against that, either.

But dishonesty is the disease that made this HMO sick unto near-death. Dishonesty and biting dishonest about that dishonesty is the common denominator of these kinds of dysfunctional disasters.

You tell me: Is it unreasonable to expect that an organization phasing in a new billing system — the mission-

critical component that assures accounts receivable, accounts payable and cash flow — would at least audit the effectiveness of its software in its earliest months? Particu-

larly if it was preaching to Wall Street about how fast it expected to grow and how important financial controls are to its business?

The answers are self-evident. The reason Oxford was "surprised" more than a year later is that it was the victim of either a monstrous deception or an even more grotesque self-deception. Not trying to know is as dishonest as ignoring what you do know.

Based on my personal experiences, most IS people do a lousy job of covering up what a miserable job their systems are doing. Indeed, "the smits" are usually rigging the books about what incompetents they are. It is incredible that the business side of the house could be so ignorant of the billing problems that the new system was creating.

The Oxford lesson isn't that mismanagement of mission-critical IS can dip the wings of a high-flyer: It's that honesty is ultimately cheaper than dishonesty. □

Schrage is a research associate at the MIT Media Lab and author of *No More 'Baaaa'*. His Internet address is schrage@media.mit.edu.

Oxford was the victim of a monstrous deception — or self-deception.

THE OTHER IS HIS WINDOWS NT® SERVER.

When Swiss bankers make Internet transactions, they do it on a Tandem® Windows NT Server-based system. And they do it with the security that Tandem brings in handling 90% of the world's stock transactions, 80% of all ATM transactions, 66% of all credit card validations, and two-thirds of all 911 calls in the United States. Tandem's cost-effective solutions for modular growth in the areas of finance, retail, telecommunications, insurance and elsewhere now bring business-critical reliability to every customer, for every transaction they make. Contact us at www.tandem.com for more information. Or call 1-800-NONSTOP, ext. 8003 to receive our latest information pack which includes the new Windows NT Enterprise Management Sampler CD.

Every second, every transaction, every customer counts.

Solutions Profile:

...the first time in the history of the industry that IT leaders from around the globe met and discussed their emerging technologies with some of today's brightest minds. The three technologies portrayed included Distributed Computing; Data Mining and Data Warehousing; and Doing Business with Internet Technologies.

Now in its fourth year, these IT leaders met with peers and industry experts to examine case studies and engage in open and honest dialogue. Within the Solution Lab portion of the program, ETS sponsor Computer Associates and its customer, Shared Medical Systems (SMS), discussed its integration of Unicenter® TNG™.

Shared Medical Systems Corporation designs systems and services to help organizations improve their quality of care, financial performance and strategic position.

Challenge

Shared Medical Systems Corporation (SMS) is the worldwide leader in providing health information solutions for the health industry. The company, based in Malvern, Pennsylvania, provides a full range of information systems and services to over 2,700 customers in 20 countries. Over 1,000 of those customers, with over 185,000 attached devices, utilize SMS for remote computing services built on IBM mainframe technology platforms running out of SMS' Information Services Center in Malvern. SMS needed to select enterprise management tools to provide their growing number of distributed computing systems customers with remote computing and remote server management deployment options.

Solution

- SMS selected Unicenter TNG from Computer Associates International, Inc. (CA) as the enterprise management tool capable of supporting these efforts. The driving force behind this selection was:
- Unicenter TNG's openness and ability to support end-to-end enterprise management within a heterogeneous network environment, and most importantly, support SMS' preferred client/server technology platform, Microsoft Windows NT Server running on either a Digital AlphaServer or Intel-based server.
 - Unicenter TNG's ability to revolutionize and simplify the daunting tasks of managing multiple enterprise-level IT environments with a Real World Interface™, a graphical user interface based on 3-D visualization and animation, and Business Process Views™, which lend a business perspective to the management of all enterprise resources.
 - CA's willingness to work closely with SMS to jointly develop SMS' remote server management services using Unicenter TNG.

Columnist is out of touch with the real world (meaning Earth)

MICHAEL SCHRAGE's column "Rocketing 15 salaries: The party's over" [CW, Oct. 6] seems to have been aimed at a planet other than Earth. Here, 15 salaries have trailed inflation for 10 years and are now recovering somewhat. In the mid-1980s, a senior programmer/analyst could make about \$50,000 per year. With inflation, that's about \$100,000 now. Yet there are few \$100,000 jobs out there. Maybe if salaries continue to increase at double-digit rates for another few years, we'll get back to past levels.

Schrage writes that we would never have witnessed the evolution of enterprise computing if programmers in the past had been paid today's wages. I quite agree, but in the opposite sense.

I take it Schrage means it would have been too expensive. Au contraire, today's low salaries would never have attracted enough good people for progress to have occurred.

Joshua Stern
Los Angeles
jstern@gte.net

SOMEDAY, if Computerworld columnist Michael Schrage ever dares to scale the walls of academia and enter the real world of business, he will discover a world governed by the laws of supply and demand. He will discover that just as he cannot will away the forces of gravity, he cannot will away higher prices when supply is short and demand is growing exponentially.

Managers who "reassert themselves" and demand that IS people work for lower-than-market wages will end up with incompetent, inert IS people, and their businesses will suffer. They will be eaten alive by much more competent competitors.

Java is a language, not a religion

HOW CAN Computerworld print a letter like Dan Pace's with a straight face ["Read the fine print of Microsoft/Sun agreement," CW, Oct. 13]? He claims that Microsoft-licensed Java "will be Windows and ActiveX, which is not what the public wants." Can you run that one by me again? Windows is the most popular piece of computer software since the day they plugged in the Univac.

If anything, Microsoft ought to charge Sun in exchange for providing Java support — Java apps are about the only thing I've found that can make Windows NT crawl on a 300-MHz Pentium. God knows Sun isn't qualified to do it right.

It's a language, not a religion, Dan.

Microsoft will get the message when customers stop buying

IN THE OCT. 13 issue of Computerworld, there were several articles about the Sun/Microsoft war ["Users caught in Java cross fire," "Users fear 'true' cross-platform will be casualty of Java war," "Dueling CEOs"]. In each, those inter-

viewed said they were going to wait until the dust settles before continuing or starting projects. They also said this war has put end users in the middle of this circus. Well, let's face it: The entire end-user community has allowed these com-

puter giants (especially Microsoft) to tell us what we want for too long. We users should start telling Microsoft — or any other vendor that tries to tell us what we want — that we are not going to stand for it. We can do this by tightening our purse strings. It's time for Microsoft to start giving customers what they want, or risk losing us.

Mercedes-Benz tries just-in-time

Dan Zirbes said Mercedes-Benz had to look outside for IS skills to build "most cost-efficient plant in America".

By Thomas Hoffman

A WARNING to the Big Three automakers: The Germans are here, and they're using aggressive pricing and a sophisticated manufacturing system to challenge those humongous profits you have been piling up in the sport utility vehicle market.

Last month, Mercedes-Benz

U.S. International, Inc. began to ship its M-Class All-Activity Vehicle from the company's first non-German manufacturing plant in Vance, Ala.

With prices starting at \$33,950, the M-Class is just a few thousand dollars more than a Jeep Grand Cherokee or a Ford Explorer. The plant raises

Bristol-Myers CEO demands massive supply chain fix

By Randy Weston

WHEN Charles A. Heinhold Jr. took over as chairman of \$17 billion pharmaceutical giant Bristol-Myers Squibb Co. in late 1994, he ordered executives to streamline global operations enough to add \$1.5 billion to the bottom line. One of the most significant projects was the re-engineering of the company's \$3 billion global supply chain.

The task meant assembling a team of 200 business and information systems people to implement R/3 business process automation software from SAP AG, based in the U.S. in Wayne, Pa. The result: a more efficient production and distribution process that the company expects will save \$50 million per year.

THE BACKBONE

R/3 will be the backbone of the system that links business-process applications, according to David Edelstein, vice president of information management at Princeton, N.J.-based Bristol-Myers. The company's critical software includes Irving, Texas-based I2 Technologies, Inc.'s advanced planning and scheduling applications and supply-chain management software from Manugistics, Inc. in Rockville, Md.

It is a task that Edelstein said was sorely needed to ensure information flowed uniformly among all divisions of the company. "When the global procurement group wanted to know how much cardstock worldwide, we had to comb through 14 accounts-payable systems to figure out how cardboard was coded in each system. It was a nightmare," he said.

With the new system, code for cardboard or any other item is the same throughout the Bristol-Myers, page 52

BEST PRACTICES

Feds win big in less-publicized IS projects

By Gary H. Anthes
WASHINGTON

GLANCES at the federal government's efforts to modernize tax, air traffic control and weather systems, and you might well conclude that Uncle Sam is utterly clueless when it comes to information systems. But in a recent study of less highly publicized projects, a government-industry team found cause for optimism.

A recent report by the federal Chief Information Officers Council and the Industry Advisory Council details 20 success stories, including the following:

- A Defense Department medical supply system based on electronic data interchange is returning \$2.6 billion over 15 years on an investment of \$662 million, has reduced inventory

Community Group
Alan Baulin
"It's responsible management to report back to your owners"

Co-op farms out IS to third party

By Jaikumar Vijayan

AS PART of a major business process reorganization that was launched in 1995, Farmland Industries, Inc. decided to centralize and standardize its information systems operations and look for ways to sell IS services to third parties.

To achieve those goals, the \$9.8 billion farmers cooperative, which is based in Kansas City, Mo., earlier this year spun off its IS organization into a separate entity jointly owned

Co-op, page 51

DOING IT TOGETHER

Why some customers and vendors are teaming up on IT outsourcing ventures:

- Lets both parties retain ownership and key management roles
- Fosters more cooperative working relationship between customer and vendor
- Holds potential for customer to make profits selling IT services to third parties
- Lets vendor expand into new sectors of the IT services industry

The rise and fall of Apple is a page-turning soap opera

They should never have called it the "Synergy Room." Because at Apple Computers, Inc., that conference space seemed to be the place where, after a great start, nothing went right and nobody worked well together.

In his book, *Apple* (Times Books: \$27.50; 443 pages), Jim Carlton chronicles all the events that led a brilliant start-up — one that helped hatch the PC revolution and gave the computer industry millions of new users — to the brink of failure. Along the way, Carlton details the don'ts every business should avoid.

In his book, author Jim Carlton chronicles all the events that led Apple, a brilliant start-up, to the brink of failure

WHEN WE WERE YOUNG

The beginning, of course, was exhilarating. Steve Jobs drove the Macintosh design team to create something "insanely great." As Apple CEO, former PepsiCo, Inc. executive John Sculley created a world-famous brand name.

Engineers slept in Apple's Cupertino, Calif., lobby to beg for job interviews. The Macintosh leaped off store shelves as IBM clones and Microsoft's operating system lagged far behind.

For a while, Apple executives — fearful they would give away the crown jewels — faced down arguments to open up the Macintosh for others to sell and enhance. Among key initiatives shouted down by a vocal minority was a plan to license the Mac OS (a 1985 memo from

Bill Gates suggests how to do it). Another, was a version of the Mac OS that would run on Intel Corp. chips (refused because it would compete with Apple's deal with IBM to build PowerPC machines).

A lot of this is well-known, of course.

but Carlton, a *Wall Street Journal* reporter, puts the stories into one encyclopedic guide to Apple's corporate soap opera — which continues today with Jobs again in charge.

My one quibble is that Carlton throws out so many names of executives and project engineers that it can be tough to keep them all straight.

But through Carlton's work comes not only a clear history of the PC industry, but also key business lessons. Among them: Don't run your company on emotion and ego; don't rely on consensus to make tough decisions; and don't be afraid of working with other companies for common benefits.

— Michael Goldberg

Companies bend to keep telecommuters productive

► Nortel establishes separate help desk

By Kim Girard
Orlando, Fla.

MANY COMPANIES nationwide are adopting telecommuting programs to offer more flexibility, save money or deal with space issues.

Nortel Corp., for example, expects that more than 3,000 of its 68,000 employees will telecommute one to five days per week by the end of the year.

To cater to home users' unique problems — often involving an Integrated Services Digital Network connection, a problematic telephone line or a modem configuration snafu — Nortel has established a separate 15-person help desk, said Tony Smith, senior manager of telecommuting services at Nortel.

"The help desk [used to take] two

weeks to answer a problem," Smith said. "We needed a help desk that catered to remote users."

But flexible support isn't the only challenge telecommuting presents. There also is the question of how to use the space left behind.

"Obviously, the way we've designed space doesn't work," said Barbara Reeves, virtual office program manager at The Boeing Co.'s commercial airplane division in Seattle, which has a telecommuting pilot program.

"We're trying to come up with something that's designed to the way you're doing work," Reeves said.

She said the challenge is working with facilities managers who operate within a separate department and control money needed to make changes. □

Nova inks \$542M deal to outsource with IBM

By Jaikumar Vijayan

COMPANIES ARE forging ahead with outsourcing deals, despite the well-publicized disintegration of some high-profile contracts.

The latest to move forward is Nova Gas Transmission Ltd. in Calgary, Alberta, the largest carrier of natural gas in North America, which recently inked a \$542 million outsourcing deal with IBM and DMR Consulting Group, Inc. Under terms of the deal, Nova will outsource all application development, technology enhancements, maintenance and support functions to DMR.

IBM will take on operational responsibility and all desktop support functions. Nova, meanwhile, will retain a huge enterprisewide SAP R/3 implementation project.

The company has transferred most of its approximately 500 information systems personnel to both outsourcers but will retain about 15 development staff to

WHY NOVA OUTSOURCED IS

handle new core projects.

The outsourcing deal will give Nova access to a broader range of services and skills and to specific application development skills, such as enterprise resource planning. It also is expected to trim the \$500 million that Nova spends annually on IS operations, according to Bruce McNaught, vice president of internal resources at Nova. He didn't specify the amount of anticipated savings. □

Co-op farms out IS

CONTINUED FROM PAGE 47

with systems integrator Ernst & Young LLP.

The idea is to leverage the operational experience of Farmland's IS organization with Ernst & Young's application development skills to sell a wide range of services back to Farmland and, eventually, to third parties.

For example, the two companies are implementing SAP AG's R/3 software enterprisewide and consolidating multiple applications spread across the corporation into more centralized systems.

The joint venture company, OneSystem Group, is expected to take in between \$70 million and \$80 million annually selling information technology operational and business process outsourcing services to Farmland and to more than 500 farmers nationwide who represent the Farmland Cooperative System, according to Chief Information Officer Kent Nunn.

The standardizations, process changes and streamlining of Farmland's IS operations are expected to save the company \$40 million per year, Nunn said.

If the venture succeeds in achieving those ambitious goals, Farmland will be among a handful of organizations to have pulled off a true joint operation of this kind, analysts said.

Under the deal, Farmland and Ernst & Young will share equally in the costs, profits and liabilities. So far, Farmland has transferred its entire 400-person IS unit to OneSystem and Ernst has transferred about 25 full-time professionals.

"The only ventures I have heard of similar to this have all been unsuccessful," said Susan Scrupski, an analyst at Technology and Business Integrators, Inc. in Woodcliff Lake, N.J.

Two notable failures this year have been Transquest, a joint venture between Delta Air Lines and AT&T Corp., and one between Mutual of New York and Computer Sciences Corp.

"The reason these things fell apart is because they were never really autonomous. They basically were trying to serve two masters: the two founding companies," Scrupski said.

Six months into the deal, both Farmland and Ernst & Young acknowledge some of the challenges involved in making their joint venture work, but both companies remain bullish.

So far, the new venture has started providing IS services to Farmland. OneSystem also recently decided to further outsource Farmland's data center operations to integrator Systems Management Specialists — a move that will save Farmland \$14 million to \$15 million in the next five years in labor and infrastructure costs.

"We continually are challenged from a communications standpoint. It is a confusing time for all the people involved [because of the dramatic changes in the way that service is delivered and the way we interact with our customers]," Nunn said. "But the venture gives Farmland a way to use technology to capture business new opportunity," he said. □

Mercedes tries just-in-time

CONTINUED FROM PAGE 47

the bar on manufacturing, taking the concept of just-in-time manufacturing to the next level with something called just-in-sequence manufacturing.

With just-in-time manufacturing, auto components such as mirrors and seats are typically built weeks in advance and delivered a few days ahead of production schedules.

Using just-in-sequence manufacturing, once Mercedes-Benz puts a vehicle through its paint shop, a computer system sends an order to a supplier such as Johnson Controls, Inc. in Milwaukee to deliver a dashboard within a few hours.

Just-in-sequence is risky. If an electronic data interchange-based system at Johnson Controls or another supplier crashes, Mercedes-Benz could be "vulnerable to a plantwide shutdown," said Robert Sigler, an automotive analyst at Sanford C. Bernstein & Co. in New York. However, the payoffs could be enormous. With 70% of its components being developed by other suppliers, Mercedes-Benz could slash millions

of dollars in inventory management costs, Sigler added.

"This is the most cost-

efficient plant in North America," said Sigler, who expects the \$500 million plant to pay for itself by 2001.

IBM IN CHARGE

That's pretty impressive, considering that the 2 million-square-foot plant was an empty field just two years ago. With no IS staff to speak of, Mercedes-Benz U.S. picked IBM to implement and manage the systems needed to run the plant.

"We couldn't do this by starting to recruit and hire people to build an IS organization," said Dan Zirbes, information technology manager at Mercedes-Benz U.S.

IBM spent months toiling

with Zirbes and a skeleton crew to get the company's The Baan Co. enterprise resource planning software up and running. Zirbes wouldn't disclose the size of the IT investment behind the plant. However, analysts estimated the cost at less than \$10 million for hardware and software.

The plant met its deadline to build its first production vehicle last February, Zirbes said. The company expects to build 18,000 to 19,000 trucks this year and 65,000 next year when the plant ramps up to full capacity.

Perhaps the biggest challenge Zirbes faced was communicating with his German-speaking counterparts.

At the same time the U.S. plant was being built, Daimler-Benz was developing a bill of materials system that Mercedes-Benz U.S. had to tie in to its Baan environment.

To work through the language barriers, the U.S. unit had a bilingual consultant act as a "middleware translator," Zirbes said. □

Feds log some IS successes amid more-public failures

CONTINUED FROM PAGE 47

from a supply of 380 days to 10 days and reduced order and shipping time from 30 days to one day.

■ A client/server system at the Food and Drug Administration is saving U.S. businesses \$1.2 billion over seven years by streamlining import processing.

■ An intranet-based federal property management system will return its initial investment in 23 months while reducing information access time from days to minutes.

The GSA's Public Building Service site offers a central point for information about real estate and services for government agencies.

"It's responsible management to report back to your owners — taxpayers and the Congress — what they are getting for the \$40 billion to \$50 billion the government invests each year in IT," said Alan Balutis, deputy CIO at the Commerce Department and chairman of the committee that found the best practices. "There really are a lot of things that demonstrate a solid return on investment, and people should see that the landscape isn't totally bleak and dark."

The projects range widely in application, size and technology, but certain elements recur: use of commercial, off-the-shelf products; outsourcing; use of the Internet and World Wide Web; rigorous focus on performance metrics; and intimate involvement of end users.

Other factors include a growing tendency among government agencies to focus on three core missions and outsource IS projects, according to government IS consultant Warren H. Suss, president of Warren H. Suss Associates in Jenkintown, Pa. Agencies are also increasingly turning to commercial ap-

plications rather than relying on custom development. And they are evaluating systems by user-oriented metrics — such as time to process a payment claim — rather than IS metrics such as MIPS or bandwidth, Suss said.

The Environmental Protection Agency won a best practices award for its Envirofacts Data Warehouse. It knits together and offers to the public 80G bytes of environmental data — information previously

available piecemeal and only to EPA specialists.

The system — whose development was outsourced — uses the Web as a common client/server, database and geographic information system (GIS) products.

"Technology became our friend rather than our foe,"

said Envirofacts director Pat Garvey. The Web site got 800,000 visits last month, he said.

AGENCY-WIDE EXPERTS

The project was a success in part because the project team, "instead of being IT techies," was made up of environmental experts from across the agency, Garvey said. He said he didn't go to the CIO for funds for a big, agency-wide project, — a strategy that wouldn't have worked given budget constraints. "We've been very creative; we've gone to individual offices that are trying to solve public access problems or data integration problems or GIS problems or data standardization problems and said, 'We'll take the money you have in your budget for that problem, and we'll solve it for you.'"

Nine of the 20 projects used Web technology. "Making customer service and data sharing Internet-oriented is just taking all kinds of risks and complexities out of development projects," said Philip Kivist, the industry Advisory Council's liaison to the CIO Council. □

Bristol-Myers CEO demands IS overhaul

CONTINUED FROM PAGE 47

company. The 25,000 employees who will use the new software — about half the company's staff — can easily call up that kind of data to better plan use of supplies and product delivery.

Customers can now get a single bill for all business they do with Bristol-Myers, whether they are ordering Clairol shampoo, Ban deodorant or any of the 300,000 other products the company makes.

"Wal-Mart does not want an invoice from Clairol, an invoice from consumer medicines and an invoice from prescription medicines," Edelstein said. "They want a single electronic transaction, and we need to get to it there."

As enterprise resource planning systems become more powerful and more critical in

maintaining the processes behind the business, they are becoming more complex to manage.

To tackle the problem, Bristol-Myers' implementation team will remain in place after the project is complete to maintain the software and roll out upgrades.

Jim Shepherd, an analyst at Advanced Manufacturing Research, Inc. in Boston, said that is a good approach. User companies, he said, need to be prepared to dedicate permanent staff to the software's management.

"Most companies are still in the early implementation phases, so they aren't yet dealing with the problems of release management," he said. "Once you get these teams together, you need to leave them in place.

This is the first asset a company has bought that begins changing the minute they bought it."

Five Bristol-Myers sites went live with the system Sept. 1, and more than 20 others are due to start by the end of next year.

By the end of 1999, all the company's 65 sites in 150 countries are expected to be connected to the system. □

Now, there's a reliable way
to automatically back up, archive
and retrieve all their
critical business information.

Presenting Network Storage Manager

A lost file here. No backup there.
Nobody in your enterprise is perfect.
Luckily, IBM has an integrated storage
solution for these sorts of problems.

IBM Network Storage Manager
gives you reliable backup, recovery
and archiving of stored data anywhere
on your network. Automatically. This
solution of powerful software and
lightning-fast hardware easily attaches
to your network like any other server.
So it's nondisruptive.

It also works across all major
computing platforms, including NT,
Sun, HP and IBM. There's a broad
family of flexible and reliable storage
solutions for just about any size
company or department. And they
can be easily upgraded as your
business needs change.

Call us at 1 800 IBM-CALL,
ext. RA062, or visit [www.ibm.com/
storage/backup](http://www.ibm.com/storage/backup) to learn how IBM
storage solutions can give everyone
access to the information they need.
Sometimes, in spite of themselves.

If the answer is Cisco, you know your network service provider is supported by the products and technology that brought the Internet to business. In fact, the Internet as we know it today is built on Cisco equipment.

Cisco Powered Network™ service providers are equipped to make your network work for you. Whether it's Internet access, ATM, frame relay or other data services, you will know your business is getting the quality it can depend on.

Look for the new Cisco Powered Network mark or visit our Web site at www.cisco.com to find out more about the participating network service providers. Either way, you will know your provider is committed to giving your business the most in reliable, secure and innovative service. And you will know it's powered by Cisco – the company that makes the world's networks work for business.

Intranet project aims to heal Bosnia

► Volunteers tap in to 'net technology

By Sharon Machlis

SOME U.S. volunteers are hoping that Internet technology will play an important role in rebuilding Bosnia-Herzegovina after its devastating four-year war.

Several groups are working to boost Internet access in cities where almost all communications were cut off by years of siege.

And academics are trying to reconstruct documents lost when Serb forces destroyed the National Library.

The latest high-tech effort, Project Bosnia, plans to set up an intranet in the Serb-held city of Banja Luka for independent journalists to communicate with one another.

"It's a useful step to open up some new channels of information exchange," said Henry Perritt Jr., dean of the Chicago-Kent College of Law, which is part of the intranet project.

Balkan experts say that media controlled by nationalist extremists spewing ethnic hatred contributed greatly to the war in Bosnia, which is why it is important today for independent media to be functioning in the country.

AT HOME IN BANJA LUKA

Project Bosnia, sponsored by the Chicago-Kent and Villanova University law schools, already has identified a home at the Banja Luka University-based media center for a donated Sun Microsystems, Inc. server. I. V. Ashtiza, a third-year Kent law student just back from Bosnia, said he hopes the next step might be a

wireless connection across the former front line between journalists in Banja Luka and Sarajevo and eventually access to the wider Internet.

The intranet project meshes with U.S. government efforts to

bolster anti-Karadzic forces within Republika Srpska, the Bosnian Serb entity created by the Dayton peace accords.

Radovan Karadzic, charged with genocide and crimes against humanity, still holds power in most of Srpska and Bosnia, page 58

"One of our major efforts is to promote independent media... [and] improve access to information."

— Janet Garvey, U.S. Embassy

Intranet eases mutual fund merger pain

By Carol Sliva

AFTER A LARGE mutual fund company in Houston merged with a London-based firm earlier this year, the chief technology officer realized an intranet would be the only sensible way to quickly link 77 far-flung offices.

The offices located around the world needed to be able to communicate and share information, but they didn't use the same technology.

"The ability for us to get on common platforms is going to take years, frankly, and we just can't wait that long in terms of our business requirements," said John Deane, chief technology officer at Houston-based AIM Management Group, Inc. AIM merged with Invenco Funds Group, Inc. in February to form a new intranet, page 59

'net phone service dials up big savings

By Matt Handlen

MARWAN ITATIM runs a satellite network marketing operation from Cyprus, Greece, and makes nearly all his international telephone calls over the Internet.

His savings: about 90% over conventional international rates.

Analysts said that is the kind of cost-cutting that should persuade network managers in large companies to at least test an Internet calling service. Savings could be just as good for companies that call internationally, although domestic rates are too low to make Internet calling cost-effective in the U.S., analysts said.

Instead of paying between \$1.50 and \$2 per minute for his local telecommunications provider, Itatim pays only 10 to 15 cents per minute for calls to the U.S. from Cyprus.

Phone service, page 58

Net2Phone users can click on a hotkeyed on a PC interface to make a call

Bosnia taps in to Internet

CONTINUED FROM PAGE 57

opposes many provisions of the peace treaty that ended Bosnia's war in 1995.

"One of our major efforts is to promote independent media... [and] improve access to information, which is still pretty limited in Republic Srpska," said Janet Garvey, public affairs officer at the U.S. Embassy in Sarajevo. The U.S. government has given financial backing to the intranet plan, she said.

Project Bosnia earlier set up an intranet in the Bosnian capital of Sarajevo, which suffered years of heavy bombardment by Serb forces. Serb gunners targeted several historic and cultural landmarks in the city, including libraries and museums that housed vitally important documents.

That intranet, still in its early stages, will be used first by the country's courts and human rights office to gain access to electronic documents where paper versions are unavailable. Other projects across the country bring legal information via intranet to regional government offices.

In the longer term, university stu-

denters are trying to help rebuild the collection of the National Library, where millions of books and several rare historical manuscripts were destroyed.

"When the National Library was burned down in August 1992, the card catalog was destroyed along with most of the collection," said Andras Riedlmayer, a bibliographer at Harvard University's Fine Arts Library. Riedlmayer has worked on several Bosnia-related reconstruction projects. They were left with no way of even identifying what it was that they lost."

OCLC, Inc. in Dublin, Ohio,

agreed to search its bibliographic database from thousands of member libraries for any Bosnia-related publications, creating a massive reference resource.

Enes Kujundzic, director of Bosnia's National Library, said the project will help not only people in his country, but also researchers worldwide who need information about the Balkan nation.

In addition, basic computer technology such as technical journals on CD is

vital in helping to rebuild the library's contents, he said. With entire collections of medical, scientific and other magazines wiped out in the shelling, it would be expensive and time-consuming to handle all new paper copies.

"We don't have much staff at our disposal," he said. "In addition to online access, CD technology is very important."

RARE DOCUMENTS

Another reconstruction attempt, the Bosnian Manuscript Ingesting Project (www.appl.com.com/maru/ingather.htm), seeks to find researchers around the world who might have visited Sarajevo to study and photocopy some of the rare manuscripts that were destroyed.

So far, the project has identified scores of manuscripts and rare photographs, and hopes one day to be able to give access to the copies over the Internet.

Future plans within Bosnia call for creating an academic computer network across former front lines, according to Kemal Bakarsic, an assistant professor in the library studies department at the University of Sarajevo.

Plans for an academic computer network link institutions in four cities

Computer technology may help access information destroyed in the bombardment of the National Library

That would incorporate Banja Luka University, which is under Serb control; two universities in Mostar, now split between Croat and Muslim sectors; Tuzla University in that multiethnic city; Sarajevo University; and the National Library.

Such a network would create links among former colleagues who were separated by nationalism and war. Technology, Bakarsic said, is helping to rebuild the country. □

'net phone service dials savings

CONTINUED FROM PAGE 57

"It means I save tens of thousands of dollars on phone calls over a year," Itayim said in an interview.

Itayim uses NetPhone for his Internet calls, a service of IDT Corp. in Hackensack, N.J. As an independent distributor of Prentiss satellite services for The People's Network, Inc. in Carrollton, Texas, he started using the IDT service nearly a year ago. He downloaded free software to his PC and prepaids regularly for Internet telephone service by credit card.

The service lets him call any phone, including cellular phones, from his PC over a 28.8K bit/sec. modem. Soon, he will upgrade to an Integrated Services Digital Network connection. He talks over a headset with earphones and a microphone connected to his PC. When connections get garbled or delayed, he can switch between two Cyprus-based Internet service providers to improve calling quality.

The Internet service costs him about a half-cent per minute per call on top of IDT's rate.

"The quality is good the majority of the time," Itayim said. "Most people don't realize I'm using PC-to-phone, and when I do mention that, they are quite surprised."

On a typical day of five hours of international calls over the Internet, he

said only 5% to 10% of the calls have problems, including garbled words or delays when one speaker interrupts the other.

QUALITY ISSUES

That reliability means "a large business wouldn't want to cold call for a sale on the Internet, but it depends on what you're selling," said Hilary Mine, an analyst at Probe Research, Inc. in Cedar Knolls, N.J.

Such quality concerns have kept large enterprises from buying Internet phone services on a large scale, analysts said. But dozens of companies provide either Internet phone services or hardware, including Internet gateway devices, and some of them have large customers with trials under way.

Lucent Technologies, Inc., in Basking Ridge, N.J., has had trials with business customers under way for a year but has had no large-scale sales.

IDT said that, after two years in the business, it has more than 100,000 customers — most of whom are residential users or small home-office users.

However, Rosemary Cochran, an analyst at Vertical Systems Group in Dedham, Mass., said companies might choose a trial service for workers within a company to call one another abroad. □

The Workgroup Group

Intranet aids merger

CONTINUED FROM PAGE 57

company, Amvescap PLC.

Rather than do a lengthy cost-benefit analysis, Deane and his electronic-commerce group forged ahead and created the intranet, confident that others would see the merits once their project was completed.

"You could see the light in senior management's eyes," Deane said. "For once, here was a technology that wasn't two years late and \$5 million over budget. It just appeared."

With an annual global information technology budget of about \$100 million and an Internet site already up and running, Deane's group had most of the necessary tools at its disposal. The group also hired two outside consultants.

"I just took a little out of here and a little out of there," Deane said. "Our intranet cost us a trivial amount of money."

Five people worked for three months at a cost of about \$300,000, Deane estimated, and equipment was no problem.

They took some back-end servers that weren't in use and added World Wide Web and certificate server software from Netscape Communications Corp.

The group also found it could deploy some of the same middleware that had been used for the Internet site, because both were performing similar functions.

AIM's Internet site not only provided general information to the public, but also allowed brokers and customers, armed with passwords, to access updated account balances and other data specific to their portfolios.

In a rather innovative twist, the Web site also offered audio updates with the latest financial news. When the market recently crashed, for instance, the AIM subsidiary got its top economists to provide up-to-the-minute commentary online.

Plans also call for audio to be used on the intranet site.

Activated earlier this month, Am-

vescap's intranet features an online photo directory of company employees, extensive information about various funds, research notes, portfolio ideas and market analysis data. And more is planned.

"We were amazed at all the information you could pull up quickly and easily," said Robert Graham, AIM's CEO and president. "It's a great way to

keep all the units around the world apprised of what's going on."

Most companies, Deane said, tend to post only policies and procedures to their intranets.

"That's not the way to really exploit the power of this," Deane said. "I think the power of this is to make our business units more productive, and therefore make more money." □

"You could see the light in senior management's eyes"

COURTESY SERVICE.

NEW PRODUCTS

DRESELHANS COMPUTER PRODUCTS, INC. has announced the Black Magic Internet Sharing Server, hardware and software that provides 30 users with simultaneous Internet access using one telephone line.

According to the Ontario, Calif., company, users need just one dial-up Internet account, an office Ethernet network (either 10Base-T or coaxial) and one phone line. The stand-alone computer's software is dedicated solely to handling traffic between the Internet service provider and users. It works with all network operating systems. User computers must be running Windows 3.5 or better or Macintosh System 7.5 or better.

The model with a 56K bit/sec. modem costs \$799; the model with a 33.6K bit/sec. modem costs \$699.

Dreselhaus Computer Products
(909) 937-1937
www.dreselhaus.com

CONTINO SOFTWARE has announced Hierarchy Web Presenter 2.1, World Wide Web presentation software with real-time document delivery capabilities.

According to the San Diego, Calif., company, the software lets presenters deliver word processing, spreadsheet and other types of documents over the Internet into audience members' desktop applications dur-

ing presentations.

The Java-based program includes compatibility with streaming audio and video, and pilot-controlled chat. Audience participants need only a Java-enabled browser.

The price is \$195 for one presenter and up to five remotely dispersed audience members.

Contigo Software
(619) 278-9900
www.contigo.com

PRINTNET has announced PrintNet, hardware and software that lets users of Printnet's ProLine printers remotely manage and access the printers with a World Wide Web browser.

According to the Irvine, Calif., company, the PrintNet network interface unit has a built-in Internet home page, so administrators can call up the page over the Web and control printer setup and network settings.

Users can access the home page screen to see online/off-line condition, print queue jobs and paper tray status.

It is available for 10Base-T and 10Base-2 Ethernet connections.

The cost is \$495 as a factory option or a field installation kit.

Estimate switching

Estimate switching, Inc. in Escondido, Calif., has announced the Virtual Channel. It lets users connect eight Small Form-factor Gigabit Ethernet LAN switches throughout a building and manage them as a single entity. Virtual Channels can handle up to 100 million connections and have a 600 Mbps, nonstop capability. It will cost \$19,995 and will ship in the first quarter next year.

Industrial Fibre Channel

Quantum Networks, Inc. in San Jose, Calif., has unveiled the Daxel Fibre Channel switch and the Gibraltar Gateway. The Gibraltar Gateway switch connects Daxel Fibre Channel buses with large-scale Fibre Channel networks. The Gibraltar switch, which is a 16-port switch, lets users connect large Fibre Channel networks to a Fibre Channel switch. It will cost \$19,995 and will ship in the first quarter next year.

Notes conversions trip up users

By Barb Cole-Gomdali

IN THE ABSENCE of strong migration tools, some users of Lotus Development Corp.'s CC-Mail have taken their conversion to Notes into their own hands.

Many companies face increasing pressure to move to a more scalable and manageable mail platform, such as Notes or Microsoft Corp.'s Exchange, as their volume of electronic mail grows and support costs rise.

Most expect to save money by moving to client/server mail, which costs less to manage than LAN-based systems' lists of

WHAT'S HOLDING THEM BACK?

CC-Mail users say the following has delayed their move to Notes:

- Lack of strong migration and compatible tools
- E-mail-centric sites see no reason to switch to Notes
- Some demand deeper discounts on Notes purchases
- Shortage of consulting services to support migration

CC-Mail. And more companies want to move to messaging platforms that support collaborative applications, said Mark Levitt, an analyst at International Data Corp. in Framingham,

Mass. But getting from CC-Mail to Notes has been difficult, especially for companies that have tens of thousands of seats.

Users at some of those orga-

Notes, page 65

Detecting intrusions is only a start

By Laura DiDio

PROACTIVE INTRUSION detection technology for Windows NT and Unix networks will take center stage at the 24th Annual Computer Security Institute (CSI) Conference this week in Washington.

"Windows NT is the hottest single topic in the security industry right now. And despite what people think about the maturity of the Unix operating system, Unix security is also high on businesses' lists [of security concerns] because hackers are still pounding away at Unix," said Patrice Rapin, CSI's director.

Jim Marshall, an information delivery security consultant at The Dow Chemical Co. in Midland, Mich., said his company

works diligently to keep up with the latest trends, products and advisories. Dow has 35,000 Windows NT users.

But educating Dow's users on the pitfalls of inadvertent security breaches is one of Marshall's biggest tasks. "The worst security breaches we've had involve users not paying attention to where they store documents. They often mistakenly store classified documents in public queues," he said.

HACKER THEAT

Careless users are a big concern, but so is the increasing number of hackers who are aiming at NT, said Bill Malik, an analyst at Gartner Group, Inc. in Stamford, Conn. "That's where the action is. A success-

ful NT hack will get them 15 minutes of fame," he said.

The host of new intrusion detection devices go beyond audit trails and event logging software. Many were specifically designed to help defend intranets, extranets and remote offices.

CyberSafe Corp. in Seattle will introduce its TrustBroker Security Suite that runs on Windows NT, Unix and IBM MVS systems. TrustBroker provides users with a single sign-on to multiple systems, and it supports public-key and secret-key authentication mechanisms.

The TrustBroker Suite creates individual trust relationships on one set of systems, then "brokers" that trust, vouching for a user to other machines across

Network security, page 68

Simple solutions satisfy

► Users pick basic management tools

By Patrick Dryden

THERE'S ALWAYS a place for cheap and simple management software—even if strategic goals call for an industrial-strength tool kit, say users of a little-known network manager from Ipswich, Inc. in Lexington, Mass.

"Big Unix platforms are worthwhile, but there's no need for a Cadillac when a Toyota will do," said Mark Watson, manager of network opera-

INTERNETWORKING

3Com switch aims at net core

By Bob Wallace

SEVERAL 3Com users said the vendor's new advanced switch will meet their long-term networking needs, but analysts said the vendor still faces challenges and stiff competition in the data center switch market.

3Com Corp. last week announced CoreBuilder 9000, a robust data center switch that can support Gigabit Ethernet or Asynchronous Transfer Mode (ATM).

It also has built-in high-speed routing, which makes it a Layer 3 switch. It is due in March. The Gigabit Ethernet and ATM support means users don't have to buy different boxes for different high-speed switch technologies. Also, Layer 3 switching can save users money by weaving them off or obviating the need for routers.

Another option

"This is a great step forward for 3Com's switching effort," said Steve Lopez, network manager for The National Board of Medical Examiners in Philadelphia. "ATM isn't in our future, but it's good to have a choice." He instead plans to deploy Gigabit Ethernet.

"This is an impressive box," said Peter Bisognette, a communications design analyst at Lockheed Martin in Pittsfield, Mass. "If it does what they say it can do, I'll be able to eliminate one router and move the other out to the WAN."

The firm would use the CoreBuilder 9000 to aggregate traffic from 25 smaller switches, which is what the two routers do now.

Notes conversions

CONTINUED FROM PAGE 42

nizations said they need migration tools that not only convert E-mail, directory information and data archives from CC-Mail to Notes, but also tools that allow the two systems to coexist.

TOUGH TO MANAGE

Lotus offers such tools, but users call them difficult and unreliable.

"You can't migrate [to Notes] over the weekend," said Jim Arcure, manager of systems integration at New York-based Colgate Palmolive, which has 26,000 CC-Mail seats.

After struggling with an unstable Lotus-CC-Mail Message Transfer Agent for nearly a year, the company wrote its own migration wizard to move data from CC-Mail to Notes.

To date, the company has moved 60 users in the IS department to Notes. "This [migration] is killing us," Arcure

said. He said he expects to move 20 or 30 users per day using the company's migration wizard.

Other users, such as Belcan Engineering Group, Inc. in Cincinnati, which has 1,000 CC-Mail seats, are taking a more phased approach.

The company lets users receive E-mail from the Internet in CC-Mail, and it is considering moving some users to Post Office Protocol 3 (POP3) clients.

Those clients will still work if the company decides to install Domino as a messaging server.

Senior network specialist Paul Budowski said a full migration to Notes may occur when the "technology and end-user requirements demand it."

Arcure said he considered POP3 clients an interim step between CC-Mail and Notes but determined that most users required the full Notes client.

Matt Cain, an analyst at Meta Group, Inc. in Stamford, Conn., said most companies can buy themselves a few years if they wish to stay on CC-Mail by taking advantage of the product's Internet hooks.

But in the long term, they will benefit from moving to a more stable mail system, Cain said.

Over time, the migration should get

easier as Lotus adds more CC-Mail-like features to Notes, makes the CC-Mail client more Notes-like and perhaps offers financial incentives to companies to move to Notes, Cain said.

Lotus officials acknowledged that the company's migration tools need work. Officials said that revisions are in the works that will make the tools easier to use. □

NEW PRODUCTS

MULTI-TECH SYSTEMS, INC. has announced the MT5612S2LX-NT, a combination Integrated Services Digital Network (ISDN) and 56K bit/sec. PC Card modem for mobile users.

According to the Mounds View, Minn., company, the card uses 56K or 33.6K bit/sec. speed over a telephone line, depending on the server or client modem being called. Its Basic Rate ISDN modem supports link speeds up to 28K bit/sec.

The card also can make calls to analog and ISDN services from the same single ISDN line, so users with ISDN can make data calls to remote applications that are serviced by analog modems.

The modem costs \$160.

TRAVELING SOFTWARE, INC. has announced Point B Remote Net Accelerator, client/server software for Windows NT and Novell, Inc. NetWare platforms that speeds up remote file access.

According to officials at the Bothell, Wash., company, the software works by placing previously accessed files in the remote computer's cache and by grouping and transferring file requests in compressed blocks.

The software was designed to increase application response times by 300% over remote access server or virtual private network remote node connections.

Pricing begins at \$1,999 for one server and to remote clients.

Traveling Software
(415) 481-8041

MIDNIGHT NETWORKS has announced Avalanche/RA, a hardware and software tool for remote access performance testing in large enterprises.

According to the Waltham, Mass., company, Avalanche/RA is a Pentium-based workstation that can establish Point-to-Point Protocol connections on up to 64 asynchronous serial ports and send data traffic in both directions.

Avalanche/RA measures performance statistics such as data traffic latency and throughput, total packets sent and received, the number of attempts required to bring up a connection, the time required to bring up a connection, and packets dropped.

Avalanche/RA costs \$39,995.

Midnight Networks
(617) 890-1000
www.midnight.com

MANGOSOFT CORP. has announced Medley97, networking software that lets Windows 95-based PCs share disk space, memory and peripherals.

According to officials at the Westboro, Mass., company, the software can create a network with up to 25 PCs in which all the attached PCs share resources and act as both a client and server. For example, if to users contribute 250M bytes to the pool, a virtual Medley drive listed under "My Computer" will have a volume of 2.5G bytes.

A two-seat starter kit costs \$249. Additional seats are \$199 each.

the enterprise. The TrustBroker Security Suite consists of a client, server and software developers kit. It is available now. Pricing ranges from \$578,000 to more than \$2 million.

Fortress Technologies Corp. in Tampa, Fla., will unveil its NetFortress Remote software. It includes a smart encryption capability that recognizes an unlimited number of "secure" network and user addresses, and automatically encrypts

communications to those addresses. The NetFortress Remote will ship Dec. 8. Pricing will be announced at the CSI conference. The conference will feature seminar topics including basic computer security, advanced secure electronic commerce, and computer crime and forensic analysis. And attendees will get to talk to their enemies on the phone. There will be a teleconference with hackers in a special session Tuesday. □

SECURITY ALERT

A recent survey on computer security found the following:

- More than half of all respondents reported unauthorized use of their computer systems within the last year.
- 47% of users reported a security invasion via the Web, up 10% over last year.
- 50% have no emergency response team.
- 60% have no network intrusion policy.
- 50% of the companies that have an intrusion policy still have no policy for preserving evidence.

Base: 563 respondents from government agencies, universities and Fortune 500 businesses

ALS

Users laud 3Com switch

CONTINUED FROM PAGE 63

Steve Toy also sees Layer 3 switching as a router replacement. "We think we can use it to eliminate some routers in the interior of our network," said Toy, an assistant network systems engineer at SAS Institute, Inc. in Atlanta. That means he could move those boxes to the network periphery to be used on the wide-area network, he said.

"And as far as Gigabit Ethernet is concerned, we're thinking of it as something further down the road," he said.

Users are anxiously anticipating the CoreBuilder 9000, but analysts stress 3Com has challenges it must meet to attract users in the high-end switch market. Part of the problem is that 3Com sells three main high-end switches whose capabilities and purposes often overlap, analysts contend.

"That causes confusion with the buyer," said Craig Johnson, an analyst at Current Analysis, Inc., a consulting and research firm in Ashburn, Va. "On the

surface, their positioning looks reasonable. But when the rubber hits the road, the question of 'Which one do I bet on?' is tough to answer."

But the product mix makes sense if users look at the CoreBuilder 9000 as the data center switch and use the other three products to feed it traffic, he said.

TAKING TOO LONG

But one analyst said 3Com is waiting too long to ship the new switch.

"3Com should have shipped these products six or nine months ago instead of [waiting until March]," said Tom Nolle, president of CIMI Corp., a Voorhees, N.J., consultancy. "Cisco [Systems, Inc.] has been sowing seeds in 3Com's accounts."

Also, 3Com admitted it faces stiff competition from Bay Networks, Inc., which several months ago bought Gigaset Ethernet switch vendor Rapid City Communications, Inc. □

Simplicity

CONTINUED FROM PAGE 63

tions at credit-card processor Nova Information Systems, Inc. in Atlanta.

Ipswitch's WhatsUp Gold supplies the "first line of defense" — basic status reports, alerts, diagnostics — for Nova's 150-node transaction-processing network without the hefty cost and training of the leading tools, Watson said.

Enhancements being introduced at Comdex/Fall '97 this week in Las Vegas may tempt more information systems managers to use the tool to fill some immediate mapping and monitoring needs.

Version 3.5, slated to ship next month, recognizes connections and devices running NetWare IPX from Novell, Inc. as well as TCP/IP intranets or extranets. Its browser interface can be modified for even simpler access by operators anywhere. And WhatsUp Gold can graphically reveal live statistics and store them for historical analysis.

"This is dirt cheap and tells us almost everything we conceivably need to know," said Bobby Anderson, webmaster at CEICO Direct in Washington.

The auto insurer manages its network with Optivity from Bay Networks, Inc., but Anderson watches his 25-node site for customers and internal users with WhatsUp Gold. "It's a reasonable way to monitor what really counts without making a strategic platform decision or budget investment," he said.

WhatsUp Gold runs on Windows 95 or Windows NT and costs \$695 for unlimited monitored devices.

At Elizabeth Arden Co., the tool "came in the back door from somebody skating the World Wide Web," said Steve Steffek,

a senior technical specialist. He had sought an easy way for help desk staffers to learn quickly about network outages at the New York-based makeup manufacturer.

"We can teach them to use WhatsUp Gold in five minutes, and within an hour they are customizing it," Steffek said. Now they see problems before they hear about them from the outsourcer managing their network using IBM's NetView, he said.

Setup is "incredibly quick" — two hours compared with a week-long course for OpenView Network Node Manager, the market leader from Hewlett-Packard Co., said Bob Brent, a network administrator at Aramark Uniform Services, Inc. in Burbank, Calif.

Though it's not the only tool Aramark uses to manage its 23-site network, WhatsUp Gold provides an easy way to monitor events and elements without deploying OpenView to 15 help desk staffers, Brent said.

THE BEST TOOL FOR THE JOB

The Windows NT platform and the Web are forcing down the cost and complexity of management, so IS managers can pick the tool that best fits the problem at hand, said Theo Forbath, a consultant at Boston Consulting Resources, Inc. in Boston.

Simpler and less expensive Windows versions of popular Unix tools are available for help desks or casual users, and browser access is becoming common. Free tools similar to WhatsUp Gold can be found on the Internet. They include IntraSpec from Asante Technologies, Inc. in San Jose, Calif.

There's no question that strategic relations with big vendors still matter. Forbath said. But tactical tools can quickly pay for themselves. □

Databases • Development • Operating Systems

Briefs

“I’ve been in the technology wars for 15 years. I’ve lived through Oracle vs. Informix and most recently Netscape vs. Microsoft Internet Explorer. And you know what? Who cares? Our business is making life easier for users. Who cares if the tools to do that are written in CORBA or DCOM?”

— David Edelstein, vice president of information management, Bristol-Myers Squibb Co.

By Tim Ouellette

IF YOU MADE a desperate trade during the stock market plunge late last month, you can probably thank middleware for get-

ting that trade through.

Even as stock markets were slammed with more than \$1 billion daily trades, packaged middleware applications worked behind the scenes to churn those

deals through, win or lose.

Middleware, in this case messaging middleware, lets applications on different computer platforms exchange data smoothly, and it can hold that

data in secure “queues” if the receiving system is down or busy.

For example, at Discover Brokerage Direct, an online brokerage in San Francisco, it wasn’t the middleware that caused the slowdown, it was the Internet.

“I had expected the slowdown to be in the processing on the back end,” said John MacLewate, Discover’s chief technology officer.

But Discover uses NeonNet, software from New Era of Networks, Inc. in Los Altos, Calif. NeonNet takes downloads from a central Wall Street mainframe clearing system and updates Discover’s Unix databases. That gives investors the exact information they need to trade online and then ensures that their trades will be reflected properly back to the central market systems.

“Should activity exceed normal transaction levels, [the middleware] queuing allows every-

Middleware, page 70

Users cautious on IBM middleware

By Sharon Gaudin

CUSTOMERS are waiting to see if IBM’s new middleware technology will keep its promise to give them more time to focus on an application’s business logic by reducing the time they spend building the hooks and ladders of back-end communication.

IBM shipped an early release version of its Component Broker middleware to a small num-

ber of users last week with general availability set for the first quarter of next year. The middleware was designed to offer back-end connections, enabling users to treat legacy applications on diverse systems like objects that can be culled and dropped into new applications.

“What this is designed for is of critical importance,” said Fima Katz, chief technology officer at Concord, Calif.-based

Concorde Solutions, Inc., the information systems arm of U.S. financial giant Bank of America Corp. “If Component Broker allows me to integrate with those back-end systems where I have all of my information, then that’s what I’m looking for.”

But Karen Boucher, director of The Standish Group International, Inc. in Dennis, Mass., is withholding judgment until she

► Hopes to avoid ‘Webtop’ war

By Gordon Mark Ung

IN AN EFFORT to avert a war that would divide the potential of thin clients and leave Windows unchallenged, vendors of Java and network computers are negotiating a common ground.

Lotus Development Corp., its parent, IBM, Sun Microsystems, Inc., and Oracle Corp. have announced a joint project called Webtop, or Webtop8. The specification, which would provide a common set of system services and application programming interfaces, was designed to assure developers that their Java applications will work unmodified on a range of network computers, PCs and other devices. Incompatibilities among such devices can create only havoc and benefit Microsoft Corp., observers said.

“Microsoft owns the leading user interface in the Microsoft environment. That is what’s up for grabs,” said Michael Sulli-

REVIEW ► Sapphire/Web Version 4.0

Sapphire melds Web/databases

By Ross M. Greenberg

IT TOOK ME four days of bating installation problems to reach the conclusion that BlueStone’s Sapphire/Web 4.0 is pretty cool—very much what the doctor ordered for solving enterprise World Wide Web-based database access woes. Accessing your database from pretty Web pages isn’t a simple problem to solve if you want to provide for security and a true client/server environment.

I wasted time installing Sapphire/Web atop an older version of Java (BlueStone ships with Java Development Kit 1.1).

Related installation/configuration error messages are nearly useless, and pertinent information on those and other installation problems are hidden away in otherwise good tutorials and manuals. This is a complex product, so time spent spelunking through those items is more of an investment than it is in

Sapphire, page 75

REVIEW ►
Sapphire/Web,
Version 4.0

BlueStone Software, Inc.
Mount Laurel, N.J.

Powerful Web-to-database development package with thought-out bells and whistles. Interfaces easily with standard databases and ODBC. Nice GUI development environment.

Great Tutorials about Java and server versions. Installation and configuration error messages aren’t helpful. Learning curve is steep to start.

Middleware on the Street

CONTINUED FROM PAGE 69

thing to go through without losing the data," MacIwaine said.

"That pretty much happened that week, with spikes during opening and closing times. Without the middleware,

we would have been prone to traffic jams," he added.

In the past, most securities houses built their own proprietary middleware packages to handle trades and ex-

changes between different systems. But the high costs of in-house development and maintenance have led many of those businesses to accept packaged applications from vendors such as New Era; IBM; BEA Systems, Inc. in Sunnyvale, Calif.; and Tibco, Inc. in Palo Alto, Calif.

"Financial services are getting big-time into packaged middleware applications today," said Jim Johnson, chairman of

The Standish Group International, Inc. in Dennis, Mass. "Today, if they try to grow their own [middleware], in a lot of cases it becomes a failure before it is even out the door" because of the limits proprietary systems place on how fast a firm can react to market changes today.

Although the Philadelphia Stock Exchange hadn't yet installed Talarian Corp.'s SmartSockets middleware when it survived last month's deluge, it still expects to get rid of its homegrown procedure calls.

"SmartSockets will bring in fault tolerance that is not completely there with our own software now," said Thomas Wittman, vice president of trading systems.

Observers said it is hard in many cases to pinpoint exactly how well the commercial middleware packages handled the high volumes because so many other pieces of the transactions could have had problems. And many firms did have bottlenecks that delayed trading and left investors at a loss. □

van-Tijm, a program director at International Data Corp. in Framingham, Mass. "We have to stay tuned for the Webtop wars. The Webtop wars could seriously shift in Microsoft's favor if people deploying Webtops all deploy something different."

So far, the companies have released few details of what the specification will be or when it will be released. A Lotus spokesman said the company is aiming for the middle of next year.

"There hasn't been a bullet-point list the industry can bite into," said Ron Rapoport, an analyst at Zona Research, Inc. in Redwood City, Calif. Rapoport said many speculated that it would include file, print and directory services.

Rapoport said he hopes the specification will apply to other than clients besides network computers to widen its appeal.

Chris Joblen, director of Internet business development at Cambridge, Mass.-based Lotus, said the spec won't exclude PCs and will be an open published standard. The companies will license the specification to manufacturers and software developers to maintain compatibility.

Andrew Diamondstein, an analyst at Giga Information Group in Cambridge, Mass., said the companies have to be careful not to confuse the market by presenting Webtop-compliant hardware as a single type of device.

"If you can create one standard, you [create the idea] that it really is one platform. [The specification] could create some market confusion as to what the platform is," he said. □

**LOTUS² ANNOUNCES AN
ENTIRELY NEW CONCEPT IN
DOWNSIZING**

THE COST OF COMPUTING ►

**.WORK THE
WEB.**

PAY ONLY FOR WHAT YOU USE AND BLOW YOUR BUDGET ON BONUSES ► NOW INTRODUCING eSUITE ► THE NEXT BIG **GIG** IN COMPUTING

A BREAKTHROUGH IDEA THAT GIVES YOU COMPLETE CONTROL. Lotus eSuite™ is your first real reason to consider network computing as a viable desktop strategy. eSuite WorkPlace™ is an integrated set of Java™-based applets combined with an easy-to-use interface, designed to bring the right tools to the right people.

eSuite WorkPlace means desktop applications reside on the server. It's like your own central command post, providing more control for easier maintenance. eSuite WorkPlace applets are small, fast and modular. You load only those tools that are essential to users. The WorkPlace desktop gives users a single point of access to everything they need — business productivity applets, legacy data, e-mail and the Web. That equates to greater productivity and a sizable reduction in overall software deployment, maintenance, training and support costs. Which all adds up to a computing budget you can swallow, or even spread around a bit.

eSuite WorkPlace IS CROSS-PLATFORM, BUILT FROM THE GROUND UP IN JAVA. eSuite WorkPlace runs on any operating system. There's no need to support separate versions for different platforms. And it's task-focused, snappy and easy to use, so you won't be running from user to user dishing out advice. Think of the dollars saved, the hours gained, the nuisance avoided. Lotus eSuite looks like a lot more than the next big gig in computing. It's the advent of an entirely new way to Work the Web.

Next steps on your agenda: learn more about eSuite technology. Give us a call at 1 800 872-3387, ext. D604. Or visit us at our website www.esuite.lotus.com for more information.

Users cautious on IBM middleware

CONTINUED FROM PAGE 45

sees the middleware and can gauge its ease of use and complexity.

"This sounds great. Critical. But IBM tends to get complicated," Boucher said. "I hope this isn't the case, but I need to see it."

Component Broker uses Common Object Request Broker Architecture (CORBA) to link browsers or other front-end applications to information and applications stored on disparate systems on the back end. It also adds common object services, transaction management and a component tool kit that offers a visual development environment.

Component Broker was designed to communicate with CICS servers and multiple databases, allowing developers to treat the applications like reusable chunks of software to speed the building process of new applications.

COMPONENT BROKER HIGHLIGHTS

IBM's Component Broker was designed to let users build applications using legacy applications, which may be on various back-end systems. Component Broker includes the following:

- Object-oriented middleware that connects disparate back-end systems
- A cross-platform CORBA that lets new applications communicate with legacy systems and lets legacy systems communicate with one another
- Connecting code that lets users treat back-end applications as objects that can be dropped into new applications
- A visual application development environment for managing the new objects

Boucher noted that Component Broker combines some of IBM's powerful middleware technologies — transaction management, object management and an object-oriented visual development environment — with CORBA's connectivity technology. She said Component Broker competes with Microsoft Corp.'s Distributed Common Object Model, Microsoft Transaction Server and MQS — single technologies that aren't packaged together.

Boucher also said that this technology, if it works, could mean a lot of time savings to the 55% of the middleware market that uses IBM technology. That's because writing code for this kind of connectivity generally takes up an estimated 70% of a developer's time.

But Boucher said she hopes Component Brokers' ease of use matches its power.

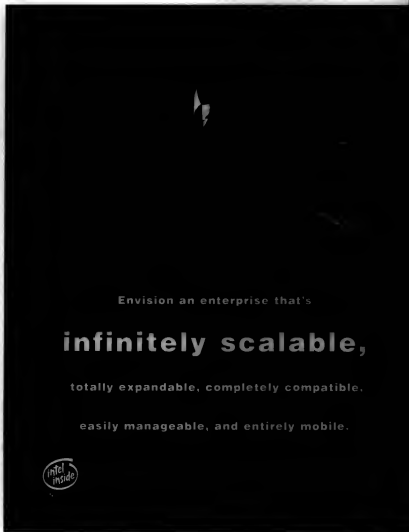

"As typical IBM middleware, it pro-

vides a lot of function, but maybe more function than anyone would need," she said. "They had 250 developers working on this thing, so it's probably going to be somewhat cumbersome."

Katz, whom IBM has briefed on Component Broker several times but who hasn't used it yet, said he is eager to see how easy the product will be to use. "How complicated will it be to develop

with?" he asked. "Will we get it on other platforms like Solaris? Will it meet these wonderful promises?"

But Katz hasn't been able to wait for IBM's middleware. He built the necessary connections using CORBA and Java to access his disparate back-end information. "We couldn't wait, but we're not married to any technology," he said. "If it works, great. We will go with the great technology." □

Envision an enterprise that's

infinitely scalable,

totally expandable, completely compatible,

easily manageable, and entirely mobile.

Sapphire gives data access

CONTINUED FROM PAGE A9

lesser products, paying off in the long run. In my case, my peculiar Windows 95 configuration was the likely culprit, but installation shouldn't have been such a big problem in any case. After I resolved the installation issues, Sapphire/

Web performed marvelously.

The product is a well-designed graphical user interface-based rapid application development tool, with native hooks to all major database products and access to other database products through Open

Database Connectivity (ODBC). It lets designers create Web pages that can access client- or server-based databases through an impressively complete and virtually transparent multilayer approach.

Splitting a database-centric application into low-overhead server and client portions is the first part of a relatively seamless operation. First, the Web page designer builds the Web pages using traditional tools, designing Web pages

for readability, transportability among browsers, resolutions and so forth. Then the pages are tied through their anchor points to the next page through a "bind," Bluestone's monitor for the interface among a page's entries for database queries, the actual query and mapping the output to the target page.

The application crosses the target page dynamically based upon the output of the query, which is filtered through templates that structure the data for presentation as the fully populated page is created.

FAST DEVELOPMENT

Optionally, the output can be fed through additional bindings and/or callback routines for further transformation and filtering. Those callbacks can use languages such as C, C++ and Java.

For testing purposes, I created a simple application: in essence a database-driven cash register, keeping current and running inventories on the server (a Microsoft Personal Web Server was used in this case), with full data-entry and database verification. Running multiple instances of the client proved that running Sapphire/Web in a real-world, real-time environment is not just doable but also relatively easy to accomplish. It took me about two days to learn the basics of Sapphire/Web, then only about a day and a half to write the application. The easy interface Sapphire/Web provided both to my database and some homegrown data verification and formatting routines made that possible.

Data entry verification and validation are easily accomplished on the client side using canned interfaces to JavaScript, VBScript or ActiveX procedures and routines that are included. It's pretty painless to provide database access through Bluestone's efficient application development interface.

Security and secure access to corporate databases comes by a variety of means, starting with traditional log-in/password challenges that stem from your database management system and server operating system. More secure third-party Web commerce access-control and encryption packages are also included in Sapphire/Web.

Sapphire/Web offers direct connections to major databases and has ODBC, Java Database Connectivity (JDBC), ActiveX Data Objects, Data Access Objects and Remote Data Object connectivity interfaces, although I only quickly tested the ODBC and JDBC interfaces.

Keeping the testing/development environment only a few keystrokes away from full enterprise deployment allows for hot updating of the appearance and interaction of the Web pages. Sapphire/Web runs on just about any Web server, according to Bluestone, and the development package runs on many popular platforms.

Sapphire/Web is a powerful system and, with no runtime license, a good buy. □

Road-warrior chic:
PDA, pager, modem

By Kim Girard

LIKE MANY business travelers, analyst Andrew Seybold becomes a power user on the road. He totes an alphanumeric pager, a wireless electronic-mail device, Motorola, Inc.'s 3.1-ounce StarTac telephone and a Compaq Computer Corp. Armada notebook.

Part of Seybold's job as editor of the Boulder Creek, Calif.-based newsletter "Andrew Seybold's Outlook" is rummaging through hundreds of handheld devices and notebooks and picking the best.

But for many users, picking and choosing the latest and

greatest from a drawer-full of gadgets and a panel of new laptops is part of the fun, whether they are status-seeking salespeople or function-demanding systems analysts.

So what's hot?

To start with, two-way pagers, wireless modems, personal digital assistants (PDAs), Windows CE handheld PCs and mininotebooks.

At the top of that pack for many hip road warriors is U.S. Robotics' \$400 PalmPilot Professional, a pocket-size PDA used for taking quick notes and managing telephone numbers and appointments.

PalmPilot, a familiar sight in

airports everywhere, has drawn a cult of amateur and professional programming enthusiasts.

Sales of so-called smart hand-

held devices such as PalmPilot — as well as Windows CE palmtops, Apple Computer, Inc.'s Newton MessagePad and

Cors Brewing Co.'s Nick Sherwood and Beltravia Ross: More

As the digital video discs turn . . .

► Users eager for DVD standard to emerge

By Nancy Dillon

BILL WILLIAMS, MIS director at Stylite Industries, said the format tag-of-war in the rewritable digital video disc (DVD) market will keep him from making a DVD storage investment in 1998. "We plan to let the dust settle and see who comes out on top," he said.

Stylite, a national manufacturer of office furniture, uses recordable CDs for catalogs and sales presentations for its dispersed sales force. "Our entire catalog lines is almost 2G bytes, so we can't fit it all on one 650M-byte CD," he said. "DVDs can store a lot more, so we're interested. But it's been really confusing."

Williams said he is also concerned about replacing his sales

force's CD-ROM drives with DVD-ROM drives. Today's DVD-ROM drives can't read rewritable DVDs. Drives that have this ability are expected early next year.

HOT MARKET

The major DVD manufacturers will try to dispel confusion about rewritable DVD technology at Comdex/Fall '97 this week in Las Vegas.

They have a lot at stake. International Data Corp. in

Framingham, Mass., has predicted that the rewritable DVD market will reach \$1.3 billion in 2001. And analysts say DVD has a shot at becoming the standard technology for removable storage.

Rewritable DVD manufacturers generally fall into two format camps: DVD-RAM and DVD-RW.

DVD-RAM discs can hold 2.6G bytes on one-sided discs and 5.2G bytes on double-sided discs. Supporters of the DVD-RAM format include Hitachi America Ltd. in Brisbane, Calif.; Toshiba America Information Systems, Inc. in Irvine, Calif.; and Secaucus, N.J.-based Panasonic Communications & Systems Co.

DVD-RW discs can hold 1G bytes per side. Manufacturers in this camp include Hewlett-Packard Co. in Palo Alto, Calif.; Philips Electronics N.V. in the Netherlands; and the San Jose, Calif.-based

NT SERVER

Newspaper
flips switch
on mini

By April Jacobs

POSTER'S DAILY DEMOCRAT is swapping its PDP-11/84-based publishing system for one that runs on Windows NT Server.

And the newspaper is finding that it can get news on the street and on the World Wide Web faster.

The Dover, N.H., paper hasn't unplugged its Digital Equipment Corp. minicomputer yet. But it has switched its daily news operation to a new publishing system that lets designers create page layouts electronically.

Newspaper, page 80

With the one system, "it would have been nearly impossible to process the files that go online daily," Phil Kincade, webmaster

Road-warrior chic includes PDAs, pagers, modems

CONTINUED FROM PAGE 27

3000 and other devices — are expected to jump about 77% this year to 5.5 million units, according to International Data Corp. in Framingham, Mass.

Despite their hefty price tags —

\$500 to \$700 for a handheld that runs a "lite" version of Windows 95 — Win-dows CE devices are also making their way into corporations.

Hewlett-Packard Co. last week rolled

out the 3601X. It has 8M bytes of memory, 10M bytes of ROM and costs \$699.

Other vendors include Philips Electronics N.V. and Casio Corp.

Nick Sherwood, information technology business analyst at Coors Brewing Co.

in Golden, Colo., said company employees use Compaq's CE 1.0 handheld for scheduling, electronic mail, word processing and spreadsheets. So far, the company has 20 of the devices.

"I see people moving more and more to them," said Sherwood, who carries a handheld, cellular phone, beeper and alphanumeric pager when out of the office. "They don't want to drag a Day-Timer around."

Sherwood said he is also interested in Toshiba America Information Systems, Inc.'s Libretto, a 2.5-pound mininotebook that was just upgraded with a 120-MHz processor and two-hour battery.

Oswaldo Guzman, a systems analyst at JC Penney Co., is waiting for the new Libretto 70 CT.

"I like it for its 2.5-pound portability

Franklin Electronic Publisher's Rex — a 1.4-ounce credit-card-size personal digital assistant — "is beautiful because it's so small and it contains all this information."

— Wayne Gushard, Sloan & Co.

and full Windows 95 [capabilities] and Microsoft Office," he said.

Burlington, N.J.-based Franklin Electronic Publisher's Rex, a 1.4-ounce, credit-card-size PDA, is flying off shelves.

It uses synchronization software to store phone numbers, names and a calendar downloaded from a user's computer.

"The only drawback is that you can't enter information manually."

"I think it's pretty clever," said Wayne Gushard, a systems manager at Sloan & Co., a building company in West Caldwell, N.J.

"It's especially good for our president, who uses Lotus Organizer and travels a lot. The Rex is beautiful because it's so small and it contains all this information," Gushard said.

Other hot stuff for the road warrior includes the following:

■ New 5-pound meganotebooks such as the IBM ThinkPad 770, which features a 233-MHz Pentium processor, a 14.1-in. color display and an optional DVD-ROM drive.

■ A new crop of Windows CE 2.0 devices. Users should expect the 2-pound devices to cost about \$4,000 and boast full-color 10.4-in. screens, flash memory, built-in modems and battery life of 20 to 25 hours, according to analysts. The machines will be based on RISC chips that will run at 200 MHz. □

WASHINGTON D.C.

ATTEND COMNET'S 20TH ANNIVERSARY EVENT

Be A Part of History — And The Future
Broadband, Wireless, Internet, Intranets, Extranets. Push and pull technologies. There's unparalleled opportunity in the communications and networking technologies now gaining in sophistication. And momentum.

ComNet's 20th Anniversary Conference and Exhibition — The Enterprise Network: Front and Center — gives you the unparalleled opportunity. Whether you're a builder, buyer, planner, or manager of an enterprise network.

Immerse yourself in 9 information-packed conference tracks. Listen to a distinguished cadre of speakers including JCom's Chairman & CEO, **Eric Benhammes**, Marimba Inc.'s President & CEO, **Kim Peluse** and Bell Atlantic's Vice Chairman, President & COO, **Ivan Seidenberg**. Join **Vinton Cerf**, the father of the Internet, and internet inventor and internet contrarian **Bob Metcalfe** as they square off in a lively discussion, moderated by **Stewart Alsop**, about the Internet's future and what that future will mean to you. And accompany 50,000 of your colleagues to view over 500 exhibiting companies at the #1 show for new product launches.

◆ #1 Show For New Product Introductions

◆ 9 Targeted Conference Tracks

Network Management and Design • Switching Tools/Technologies/Strategies • Collaborative Networking • The New WAN • Enterprise Intranets • Network Reliability/Performance • Remote Network Access and Security • Global Telecommunications: Issues and Answers • Open Forum

◆ Intranet Village (co-sponsored by Network World and Vertical Networks)

A gathering of companies with products to help you design, build and manage your Intranet.

For general event information visit our Web site at www.comnetexpo.com or call 800-545-EXPO.

Delivery Man.

"I'll never forget the day the CIO came into my office and told me we needed a better storage solution. One that would let us access and secure information from any department, anywhere in the organization. It had to be fast, reliable and work with our UNIX® NT® and NetWare® platforms. I crossed my fingers and said I'd do it. Then I called StorageTek®. And today I delivered on that promise — on time and on budget." Call StorageTek at 1 800 786-7835. Or visit us on the Web.

After all, when you've got the experts on your

side, establishing a long-term storage solution isn't a question of luck, just a matter of delivery.

Newspaper flips the switch on Digital system

CONTINUED FROM PAGE 27

Previously, staffers had to output strips of text and paste them onto dummy pages, which were transferred to the printing presses.

The new system required that Foster's buy new desktops and servers.

But in return, the switch has simplified the production process and reduced support issues, said Bob Sullivan, manager of information systems at Foster's. Sullivan said he and his team of three support staff can troubleshoot seven Microsoft Corp. Windows NT Servers and about 45 desktops running Windows NT Workstation.

By contrast, the Digital PDP 11/84 system sometimes required a service technician to come on-site to fix a problem.

Sullivan supports about 150 users, none of whom are still working on the PDP-11/84-based system until the transition to NT Servers is complete, he said.

ALMOST THERE

The project, which took about six months from start to implementation for the news department, will likely take another several months.

With the new system, Foster's IS staff can troubleshoot seven new Windows NT Servers and about 45 desktops that run Windows NT Workstation. The Digital system often required repairs from an outside service technician.

Foster's is still searching for software that can handle the ordering and placement of classified advertising and meets the company's requirements.

Technology wasn't the only hurdle; editorial staffers accustomed to certain text interfaces had to learn a whole new one.

Sullivan said he and other support staffers conducted training sessions for each group of editorial people — writers, copy editors and editors — to make sure that each understood how the new desktop systems worked.

The old system was left up and running in case any glitches occurred to ensure that the day's paper went to print on time, he said.

The new system uses layout software from Quark, Inc. in Denver to create pages electronically. News stories are created in Microsoft Corp.'s Word.

That allows them to be HTML-enabled, said Phil Kincaid, Foster's resident webmaster.

Under the old system, Web editors had to "jump through a thousand hoops to get the file formats to be correct," Kincaid said.

"Under [that] system, it would have been next to impossible to process the hundred or more files that go online daily," Kincaid said.

The paper produces three online edi-

tions daily.

The new system also helped Nov. 3 with local and regional election coverage, he said.

The newspaper staff worked with a

local radio station to post election results for most of the paper's coverage area in southern New Hampshire by 9:30 that night — before any print editions were able to give readers results. □

Users waiting for DVD standard to emerge

CONTINUED FROM PAGE 17

division of Sony Corp.

The formats will record differently, so users planning to read rewritable discs in future DVD-ROM drives will have to check for compatibility.

The Hitachi and Panasonic products are due first — within the next two months. The U.S. announcement of Toshiba's entry will be at Comdex. Toshiba's drives will ship early next year.

Sony will give the first public demonstration of its DVD-RW drive at Comdex. HP and Philips also are expected to give demonstrations. DVD-RW drives are expected late next year.

Get a grip.

Is PC network technology driving you crazy? You need a systematic approach in managing information technology assets. In other words, you need a plan.

Which is where we come in. We've spent the last few years tracking, compiling, analyzing, indexing, cross-referencing and quantifying best practices in asset management.

And it's all detailed in the **ASSET MANAGEMENT INDEX™**, a report that explains how to reduce technology costs, improve end-user productivity and competitive standing, and raise the overall return on your high-tech investments by up to 13%.

So call 1-800-272-9792 for your free copy today.

No strings. No surprises. Nothing to lose. Just a little advice on how you can control technology. Before it controls you.

ASSET MANAGEMENT • BUSINESS CONTINUITY • NETWORK SERVICES • LEASING

"We don't expect a resolution between the two formats until 1999," said Mary Bourdon, an analyst at Dataquest in San Jose, Calif. "But the companies first to market may have an advantage if their drives work," she said.

"I would not predict DVD to be the chicken in every pot for business users," Bourdon said. "But once the street price goes under \$500, it will be an appealing storage device for PCs." Pricing for the already-announced DVD-RAM drives will start at about \$750.

International Data Corp. says the rewritable disc market — which includes drives such as the one above — will reach \$1.3 billion by 2001.

Connie Cummings, president of Priority Payroll Services, Inc. in Fort Collins, Colo., uses a 3.5-inch floppy tape drive to back up individual payrolls for more than 200 client companies. "You bet we are interested in DVD storage," Cummings said. "If DVD becomes a standard like CDs are today, I wouldn't have to carry my portable tape drive to client sites to give them their accounting information." The IRS also requires that Cummings keep payroll processing records for four years. "I'm interested in the durability and compact size of DVDs," she said. □

NEW PRODUCTS

INFOMAGING TECHNOLOGIES, INC. has announced the 3D FaxPal Plus, a hardware device that sits on a telephone line and stores incoming faxes when the receiving PC is turned off. According to the Pleasanton, Calif., company, the fax peripheral operates as a personal fax server that can store up to 20 pages. It costs \$169. **Infomaging Technologies** (510) 485-4000 www.infomaging.com

INTERLOGIC INDUSTRIES in Melville, N.Y., has announced the FMCKVX, a 300-MHz Pentium motherboard with a maximum of 384M bytes of dynamic RAM.

According to the company, the single-board computer includes a Peripheral Component Interconnect bus, an integrated drive electronics hard-drive interface and a video chip with 3M bytes of memory.

It costs \$500 for a single board.

Data Warehousing

Special Section: Data Mining • Decision Support • Strategies

Briefs

FINDING FAULT

Why data warehouses fail to improve corporate profits:

- Flawed design or implementation of warehousing technology
- Built without adequate understanding of business issues
- Failure to directly link the warehouse environment to business applications

Source: Novartis Group, Inc., Philadelphia, Pa.

Consolidation wave breaks right for users

By Craig Stadman

MORE AND MORE data warehousing vendors are exchanging vows at the altars and acquisitions altar. And users who have had to shoulder the burden of stitching together different warehousing tools are only too happy to throw some rice.

Data warehousing vendors are teaming up to cover more bases than they could on their own. More than a half-dozen deals have been consummated since July on both the development and front-end analysis sides of the warehousing process (see chart, page 86).

The couplings should help make data warehouse construction less of an ordeal if vendors follow through on their promises to create ready-to-use bundles of packaged software, said several information systems managers who have slogged through

warehousing projects.

"Building a data warehouse today is kind of like building your own Swiss watch," said Greg Alvarez, warehousing administrator at gWest Group, Inc. in White Plains, N.Y. "When you look at all the software products you need, it's hard getting all that to work together in a powerful way."

gWest, an international wholesaler and retailer of women's shoes, spent about 18 months developing a pilot data warehouse based on Red Brick Systems, Inc.'s decision-support database. The warehousing went into use late last year and will eventually store wholesale merchandising information on all of the company's 13 shoe brands.

Alvarez said he started with a list of 65 warehousing vendors sorted into various tool cate-

gories. At the back end, gWest eventually decided that writing custom Cobol programs would be easier and less costly than piecing together a mix of data extraction, transformation and cleansing tools, he said.

The custom-code route continues to be popular among users. A recent survey of 2,100 data warehousing sites by Meta Group, Inc., a consulting firm in Stamford, Conn., showed

COMMENTARY

Elusive warehouse productivity

SHAKU ATRE

EVEN IF computers replaced all office workers, some critics would still tell us they hadn't boosted white-collar productivity. Like the paperless office, white-collar productivity never arrives, and nobody can explain where it goes.

Yet we're told that computers have increased productivity on the shop floor and in factories. And for more than 40 years, mainframe applications for billing, accounting and financial systems have turned office work into efficient, profitable, factory-like operations. But not all white-collar workers perform routine tasks that can be evaluated by efficiency experts armed with a stopwatch

and clipboard. Some make decisions or support others who do. How do you measure their productivity? By how many decisions they make or support or by how fast they do it?

Those are the people who use data warehousing. If you can't measure their productivity, it's hard to claim that data warehousing will improve it. And that can make data warehousing a tough sell. Senior management may demand

guaranteed productivity boosts—that is, a return on investment (ROI). But a data warehouse aims at qualitative improvements that ultimately will impact the bottom line but can't be measured by a stopwatch

More, page 86

Health-care project results in timely financial reports

By Linda Wilson

IN THE OLD world at Allegiance Healthcare Corp., hurried managers, embroiled in competitive battles in a cost-conscious marketplace, were stuck with limited and inflexible financial information available in paper-based, end-of-month reports.

In the new world, with sophisticated software and a data warehouse, flexible information is updated daily and is available electronically with a few clicks of a mouse.

Getting there wasn't easy. The company, in Waukegan, Ill., first replaced outdated mainframe operations systems with the notoriously complex SAP

R/3, a client/server-based suite of business applications from SAP AG in Walldorf, Germany. Then it built a separate decision-support warehouse and integrated it with R/3.

The payoff? The ability to keep close tabs on sales, returns and other key performance indicators, which is an important way to control costs and thus increase earnings.

"It starts from payer and insurance companies, who want to reduce the cost of health care, resulting in pricing pressures on hospitals, who cut their supply budgets," explained Bert Bierschke, health care

Warehouse monitor

Teleris Technologies LP in Roseland, N.J., has released Java-based data warehouse management software that can be used to analyze databases, end-user and query activities for signs of impending performance problems.

The Teleris Systems software includes artificial intelligence technology that analyzes usage patterns and can cut off resource-hogging queries before they bog down warehouse performance, company officials said. It runs on Unix and Windows NT servers. Prices start at \$25,000.

Tools upgrade

Informatica Corp. and Dell, Inc. both announced data warehousing tools.

Informatica in Menlo Park, Calif., promoted new software for centrally managing networks of data marts. The \$49,900 PowerCenter product is due to ship early next year along with an upgrade of Informatica's PowerBuilder development tool, company officials said.

Dell in San Jose, Calif., unveiled an upgrade of its proprietary data extraction software with added database support and new operational management features. Separately, the firm says it will ship new data to ship early next year.

FREE for a Limited Time...A CD ROM Preview of

The Top New Data Warehousing Software

*When 200,000 IS managers were asked to
choose the top software for data warehousing,
their answer had a familiar ring:*

SAS® software from SAS Institute.

As the only end-to-end solution for rapid data warehousing, SAS software delivers everything you need to manage, organize, and exploit your business data. The tools you use to build a data warehouse are the same ones used to maintain it... run it...and change it. And what's more, everything's scalable. Jump right into enterprise-wide information delivery applications...or start small and build on your success.

SAS software doesn't consume overhead for database features you don't need. And once you have data in the warehouse, you'll find everything you need for data query and reporting, OLAP/multi-dimensional analysis, data mining, database marketing, data visualization, and much more. It's never been easier to access your data...or to arrive at informed decisions by turning raw data into real information.

Consolidation hits warehouse vendors

CONTINUED FROM PAGE A2

that 55% are still writing their own programs to handle at least some pieces of the back-end data preparation process.

The persistence of the do-it-yourself approach makes things hard for some warehousing tool vendors, said John Ladley, a Meta Group analyst. "The No. 1 competitor for all of the packaged products is Cobol, and business just isn't growing fast enough for all of the companies," he said.

Another factor pushing vendors into one another's arms is the spread of data warehousing to a wider base of corporate users who view its business analysis and decision-support capabilities as crucial competitive weapons, said Wayne Eckerson, an analyst at Patricia Scrymgeour Group in Boston.

BIG IS BEAUTIFUL

"As the market gets bigger, the customers are getting more conservative," Eckerson said. "Mainstream companies don't want to buy tools from small vendors and then have to integrate them. There's a shakeout going down because [vendors] realize you need deep pockets now."

The need to bulk up financially was cited in several recent

deals, such as Minneapolis-based Aperitus Technologies, Inc.'s acquisition of Carleton Corp. in Billerica, Mass.

Carleton initially tried to expand beyond its mainframe and AS/400 data extraction roots by signing deals to integrate and resell other tools with its software. But the company quickly learned it needed to get bigger fast, said Paul Flückiger, Carleton's president.

"The strategy we had was pretty ambitious, but the market is moving too quickly," he said. "A lot of small companies are going to get scooped up."

Ladley said all the deal making could cause short-term confusion for users while merging vendors sort out their reporting differences. And the promised integration of products won't happen overnight, he added. For example, it is expected to take Aperitus and Carleton up to 18 months to give their tools a common user interface and meta data layer.

Jack Nealon, data warehouse manager at the U.S. Department of Agriculture's (USDA) national statistics service in Washington, can attest to the difficulties vendors sometimes have swallowing acquisitions.

When Nealon began evaluat-

ing warehousing technology, he had trouble getting answers to technical questions from one vendor that had just bought a specialized decision-support database. "It looked like we were dealing with a company where no one knew anything about the product," he said.

But the promise of vertical integration sounds good, Nealon said. For example, Red Brick's recent purchase of data warehouse generation technology may simplify the USDA's warehouse expansion, he added.

Ray Pyle, chief information officer at the Blue Cross/Blue Shield Association's federal gov-

"There are thousands of tables that are tightly integrated. To get the data out of SAP R/3 and move it to the warehouse, we had to figure out what tables get updated and why they get updated" when new information is entered, Ciekutis said.

Allegiance also evaluated ETI-Extract from Evolutionary Technologies International, Inc. (ETI) because Allegiance had already purchased the conversion tool to link R/3 to operations systems on older platforms. "We found that the tools, which are supposed to help with the extraction process, were hard to get to know," Ciekutis said.

So the group decided to write its own programs in ABAP. It took about four months to write and test them. The warehouse resides on a Digital Equipment Corp. Alpha 8400 server that runs Oracle Corp.'s Oracle 7.3 relational database management system. Users access data from the warehouse using Business-

object health plan in Washington, agreed that the consolidation trend should help users.

"I've thought this was necessary for a long time," Pyle said. "People are really looking for complete packages, not just a piece of technology that needs to be integrated with other products."

Pyle's unit, which handles \$7 billion worth of health insurance premiums per year, wrote its own Cobol code to extract, cleanse and load data for warehousing. The warehouse holds about 300 gigabytes now and is scheduled to grow to nearly 2T bytes by late next year. □

Objects from Business Objects, Inc. in San Jose, Calif.

Allegiance began the warehouse project in October 1996 and brought up all financial tables and 500 users this year. The distribution and production planning tables and 60 distribution centers will be added by the end of next year, bringing the total number of warehouse users to 3,000.

The warehouse has already allowed the finance staff to restructure the report process, said Mary Pat Raleigh, financial information manager. Using BusinessObjects, the staff built template-type standard reports that users can customize. The template for profit/loss, for example, lets a user look at monthly, quarterly or annual figures.

"With good reports, you know where your business is heading," Raleigh said. □

Wilson is a freelance writer in Glen Ellyn, Ill.

Atrre

CONTINUED FROM PAGE A3

be difficult to predict. You need business justification that goes beyond ROI.

That justification could be regaining control. Computers have enabled companies to grow larger than ever before. But the resulting monoliths are often virtually unmanageable. And even smaller companies have become ensnared in complexity and bureaucracy.

Data warehousing is about strengthening control by improving the quality of decision support. It extracts actionable information from reorganized versions of the operational data a company already collects, perhaps augmenting it with external data sources that help illuminate the internal data. Data warehousing is often a diagnostic tool for spotting trends and reading between the lines.

Here's how to justify it: Start at the beginning. Identify your firm's corporate goals and objectives, then formulate the business analysis issues that will promote those goals.

Next, define the information requirements for each business issue and identify subject areas. Give the results to line managers, showing them the kind of business intelligence questions the warehouse can answer.

Get input and refine your plan. Define deliverables where possible. For example, explain that a warehouse would allow you to create a unified client profile detailing all the products a client has purchased and the client's spending record over time. Then you would be able to identify clients buying patterns, find cross-selling opportunities, figure out which customers are most profitable and identify purchasing trends. Using third-party market and economic data, you'd be able to design an array of "micro-marketing" strategies.

That approach will engage the imagination of your executives. They know the business and won't need plenty "guesstimates" to realize the potential value of a client profile to their management goals. If you try to justify the project on the basis of estimated ROI, you easily wind up back in the search for white-collar productivity. Which nobody has ever found. □

Atrre is president of Atrre Associates, Inc., a consulting firm in Fort Chester, N.Y. She can be reached at shah@atrre.com.

Project leads to timely reports

CONTINUED FROM PAGE A3

group vice president at Duff & Phelps Credit Rating Co. in Chicago. Cost and payback figures weren't available from Allegiance.

Allegiance, spun off by Baxter International, Inc. last year, operates three health care businesses: supply distribution, surgical and respiratory therapy supply manufacturing, and materials-management consulting.

Allegiance purchased the Financial, sales, distribution and production-planning modules of R/3 as part of a corporate re-engineering effort begun in 1994. It opted for a separate decision-support warehouse be-

cause it concluded that R/3's database design was best suited to operations and not reporting functions. Operational databases are generally structured to support quick data entry, whereas decision-support databases are structured to support quick data retrieval. "They are fundamentally different data models," said Mark Ciekutis, data warehouse manager at Allegiance.

The decision to build a separate warehouse didn't come without costs. A crucial and very difficult part of the project involved devising a way to transfer data nightly from R/3 to the warehouse.

That was because of R/3's complexity and use of a proprietary programming language, ABAP. The application programming interface in the 300 version haven't made the task easier because they are geared toward transaction environments and not decision-support warehouses.

NCR turbocharged Union Pacific's data engine.

"We wanted a data warehouse powerful enough to handle complex business questions and scalable enough to take us into the next century. The NCR Teradata® database made NCR the obvious choice."

When Union Pacific was looking to implement an enterprise-wide scalable data warehouse strategy, they asked NCR, the world leader in data warehousing, to get the project started on the right track.

Our NCR Services professionals helped Union Pacific consolidate dozens of disparate systems into a single 1.1-terabyte scalable data warehouse that captures and stores all their mission-critical transportation and logistical information.

Running our NCR Teradata database on our scalable NCR WorldMark™ servers enables unmatched, ad hoc, complex business questions. This gives Union Pacific's 2,300+ users the power to track everything from accounts payable to locomotive and car movement, resulting in millions of dollars in savings each year.

To learn more about how NCR can help you set up a scalable data warehouse that's perfect for your business needs, call 1 800 CALL-NCR, ext. 3000. Or visit us at www.ncr.com. To learn more about Union Pacific, visit www.up.com.

THAN THE SYSTEM
MANUFACTURERS'

*Good luck finding
any other differences.*

GO AHEAD. SCRUTINIZE. 800 hours. You'll soon find that the only thing different about Kingston® workstation memory is the price. That's because we use the same premium components as the

system manufacturers. And because we design and test memory for more than 4,000 different systems, we've become the expert in compatibility, customization, and configuration. Think about

it: With Kingston you can afford twice

as much memory, while maximizing your systems' performance. Or just pocket the dramatic savings. To find out more about UNIX and Windows® NT workstation memory, call Kingston at (800) 337-7028. Or check out our Web site at www.kingston.com/ad.

Kingston memory is guaranteed compatible and is backed by a lifetime warranty with free technical support.

Annual Skills Survey

PAYING THROUGH THE NOSE

By Miryam Williamson

Name your skill, and you're gonna pay — **DEARLY** — to either get it or keep it on staff. Our third annual skills survey finds nearly all IS skills now command a salary premium, some over 30%!

Tim Gurbick has the kinds of skills that make recruiters salivate. But when they call him, Gurbick tells them he's not interested in moving on.

Gurbick brought knowledge of several Unix dialects, TCP/IP and Ethernet networking when he signed on as network engineer at Teachers Credit Union in South Bend, Ind., just over a year ago. He's since learned frame relay, Integrated Services Digital Network and Fast Ethernet.

"Given my Unix background and my new skills, I wouldn't have much difficulty finding another job," Gurbick says. "But one cannot overestimate the value of inertia. I'm happy, well-treated and well-paid where I am." He's clear about that with recruiters who call him and listens only to opportunities within 150 miles of South Bend.

With the attributes Gurbick boasts, it's no wonder he's being heavily courted. After all, networking topped the charts in *Computerworld's* 1997 skills survey, in which 542 mid- and senior-level information systems managers reported on skills they are planning to hire and train for in the coming year and on salary premiums currently paid to staff and contract workers with specific expertise. (Salary premiums are the amount of additional compensation paid to an employee for hav-

PAYING THROUGH THE ROOF

CONTINUED FROM PAGE 29

ing a specific skill vs. someone in a similar position without the skill.)

LAN skills are hot, but even more in demand are people proficient in designing and managing wide-area networks, says Neal Fisher, president of PPS Information Systems Staffing, a Baltimore recruiting firm. Fisher ascribes this to the continuing trend toward corporate mergers.

"With all these takeovers, you know how important it is to be linking these

isn't certified. "By hiring someone with exposure to NT but no certificate, I'll save considerably," he says.

People with Internet skills can find jobs anywhere, it seems. Fisher notes a steady increase in calls from employers seeking experienced webmasters fluent in Hypertext Markup Language, World Wide Web development languages and authoring tools, particularly FrontPage. Internet developers who know Java may find themselves especially welcome in Kentucky, Tennessee, Alabama and Mississippi, according to survey results.

COBOL COMPETENCY

Language competencies most often sought are C++ and — oot surprisingly — Cobol.

"People with legacy Cobol skills have

major corporations," Fisher says. Hiring managers seem especially interested in folks who know TCP/IP and Windows NT — client, server or both.

IS contractors with SAP implementation experience can attract salary premiums averaging 40%, and PeopleSoft, Inc. skills draw an average of 33.6% above ordinary hourly rates. Baan experience can mean 25% higher paychecks, and Oracle Corp. skills, both on the application and database sides, command a not-too-shabby 25% premium. Permanent staff members trade stability for premium pay, attracting somewhat smaller salary premium bonuses.

SEALED AND CERTIFIED

Michael Lamore, PC help supervisor at ADP Dealer Services' Portland, Ore., facility, expects to pay a premium for a Microsoft Certified Engineer. "Certification will give me the assurance that the person is fluent in Windows NT," he explains.

Lamore says he is also looking for a help desk technician who knows NT but

experienced a bit of a rebirth because of the year 2000 problem," says Greg Sclepp, executive director at RHJ Consulting in Menlo Park, Calif., a subsidiary of recruiting firm Robert Half International, Inc.

Contract Cobol programmers can look for pay premiums averaging nearly 27%. Not bad for a skill many were calling dead only a year or two ago. But for some, pay gratification may be delayed. Michael T. McCarty, senior director at Johns Hopkins Health Systems in Baltimore, says he is considering a bonus for year 2000 technicians, part to be paid at the end of 1999 and the rest a few months into the following year.

"If we artificially inflate salaries now, what happens in 2002?" McCarty asks.

The combination of Microsoft Visual Basic and Visual C++ skills is particularly compelling to software development managers. Programmers fluent in C may want to catch the next plane to one of the Mountain states, where two-thirds of survey respondents are looking for them.

The "Most Wanted" skills

The top technology skills, according to the percentage of companies expecting to train for them and hire for them next year:

5	Optical Ethernet	10%	10%	10%

(Note: All percentages have been rounded off to the nearest whole number.)

Where hiring is concerned, no geographical dead spots show up on the skills survey, but activity is highest in New York, New Jersey, Pennsylvania, Ohio, Indiana, Illinois, Michigan and Wisconsin. Similarly, no industry leads in hiring demand, but metal, plastic and rubber manufacturing leads that industry segment, and government registers highest in the nonmanufacturing area.

Fisher says he gets the most requests from the insurance and investment industries. While the entire U.S. is doing well in terms of job opportunities, Atlanta and Houston are particularly active in hiring at the moment, he says.

TRAIN WHO YOU HAVE

Although 36.6% of respondents reported increased hiring plans, 51.3% intend to improve the skill levels of existing staff. Kevin Butterbaugh, vice president of Teachers Credit Union, plans to spend between \$50,000 and \$75,000 on training. "We want to be self-reliant in supporting the systems we have and not depend on third-party contractors," he says.

Butterbaugh says he also sees an emphasis through the new, page 32

The right skills

at the right time

Mindy Hall-Leno, systems administrator at ADP Dealer Services, found her way into her profession almost by accident.

Just out of high school in 1986, she started work in a hospital's materials management department. When a new manager came onboard and decided to automate the operation, Hall-Leno was picked to participate in choosing the hardware and developing the software package. "Because I was new and wasn't biased to any particular computer system or software," she says.

A subsequent job as a customer service representative brought her the opportunity to obtain Novell network certification.

At ADP Dealer Services, she learned Windows NT networking. Now, five months after joining ADP, she is coordinating the rollout of Microsoft's Systems Management Server. She is almost entirely self-taught.

"There's a lot of good information out there, self-training videos and books," Hall-Leno says.

Well-trained, well-paid, staying put

Heading a team of five, Stan Hill, LAN/WAN architect at Johns Hopkins Health Systems, takes care of that organization's Windows NT network, including a 600-node network of public subscriptions that allow some 2,000 hospital workers to log on at any location.

Hill's group also handles software management and distribution. Hill says Hopkins hired him three years ago "because I knew what NT stood for and they were desperate."

Recruiters call him frequently, he says, but "here I can get all the training I want, and they pay me pretty well." It would take a hefty increase to get him to move. "Unless what I'm making might get my attention," he says. He thinks the next hot technologies will be ActiveX, data warehousing, data mining and anything related to the World Wide Web.

His advice for someone just starting out: "Learn Visual C++ and Visual Basic and you won't have to worry where your next meal is coming from."

Finders, keepers

Hiring managers say the following are the most effective methods of finding the IT talent and skills they need:

Rank	RECRUITING METHOD	RESPONDING
1	Newspaper/magazine ads	40%
2	Placement/recruiting firms/headhunters	40%
3	Internet ads	14%
4	Referrals from peers/friends/industry contacts	13%
5	Networking	9%
6	School/college recruiting	7%
7	Word of mouth	7%
8	Referrals from current employees	7%
9	Train in-house or promote from within	6%
10	Contractors	6%

(Note: All percentages have been rounded off to the nearest whole number.) Base: 542 IT managers

Hiring is Hell

Hiring managers say the hardest skills to find in the past 12 months were:

Rank	TECHNOLOGY SKILL SET	RESPONDING
1	Oracle (database)	14%
2	Calix	10%
3	Unix	9%
4	Networking	9%
5	Windows NT Server	8%
6	Database/relational database skills	7%
7	Windows NT	6%
8	AS/400	6%
9	Other specific networking skills	6%
10	Other mainframe/mainframe-related skills	6%

(Note: All percentages have been rounded off to the nearest whole number.) Base: 542 IT managers

PAYING

CONTINUED FROM PAGE 51

vestment in training as a way to keep employees from straying. He says it's one way to show technical professionals they are valued.

To retain skilled people, McCarty persuaded senior management to restructure pay scales, leaving behind the traditionally lower rates that hospitals pay and adopting rates that reflect the IS industry as a whole.

Whether a technical professional prefers to work with applications or networks, flexibility is key to success in today's job market, Fisher says.

MICROSOFT IS HOT

McCarty notes that although Windows NT gets all the attention, the really hot employees are those equipped to work with the newest technologies, and those he lists all come from Microsoft — Win-

dows NT, software management, Zero Administration Kit LANs, "anything that helps companies drive down the total cost of ownership."

Asked to name today's least valuable

skill, McCarty replies, "Novell knowledge. In our environment, the number of NT LANs is growing 10% to 15% a year, and the number of Novell LANs is being reduced by 5% or 10% a year."

Oracle experience is the top database product on his clients' shopping list, drawing salaries of \$50,000 to \$100,000, depending on experience, Fisher says.

But conventional software developers are apt to find pickings growing slimmer as packaged software crowds out proprietary applications.

One exception: Developers familiar with object orientation are starting at \$50,000; those with three or four years' experience are earning double that and more.

As outsourcing continues to grow, independent contractors are seeing pay offers from \$60 to \$200 per hour, Scleppe says. But the contractor role isn't for everyone.

"You've got to have the personality for it, to be able to meld into an organization and get up to speed quickly," Scleppe says. "The demands are higher, but the reward from a financial and career satisfaction standpoint is higher, too." □

Williamson is a freelance writer in Warwick, Mass.

BIG cash for consultants and contractors

Take the word "information" out of
IT, Peter Kane argues, Page 104

Managing

ONE MANAGER'S LOOK AT

TCO

By Brian D. Jaffe

Forget those total cost of ownership numbers, says an IS manager in the desktop trenches. A common-sense attitude, tempered with skepticism, is what it takes to cut desktop costs. Here are 25 ways to save some bucks.

I'm always eager to reduce the total cost of ownership of desktop computing.

As an information technology director responsible for PCs and LANs in a 1,000-user environment, it's an important issue for me. But watching everyone try to outdo one another with claims of lower total cost of ownership (TCO) is like watching politicians make campaign promises about tax cuts. Talk is cheap, but what about delivering the goods? All the TCO gurus seem to agree that an average shop can reduce total cost of ownership about 15% by implementing various best practices. So my editor asked me to look at some of the best practices being touted. I did, and I've got to tell you, while some seemed to have obvious benefits, others made me wonder if I was being sold the "trickle-down theory" of economics.

Here are the top eight best practices, and my rating (see box above right) on how much of an impact they can have on reducing TCO:

● **Define and enforce hardware, software and configuration standards.**

The fewer the number technology platforms in an environment, the easier support should be. Likewise for any hardware and software setups.

TCO, page 96

Ratings

- ★★★★ When you're getting serious about reducing TCO, start here.
- ★★★ Very worthwhile way of reducing TCO.
- ★★ Will make more of a scratch than a dent.
- ★ Well, it can't hurt.

"TCO reduction

ONE MANAGER'S LOOK AT

TCO

CONTINUED FROM PAGE 33

I have no argument here. The less variation there is, the easier it is to support. Defining standards generally takes an up-front investment of only time, followed by regular reviews to evaluate and update.

The downside: Enforcing standards requires finesse when every user thinks he has unique requirements. And you'll never get unanimous agreement. In my shop, we still argue over desktop vs. minitower: Is it worse to bang your head on the bottom of the desk or to move someone's precious collection of windup toys to get to the CPU?

But despite the debates, standards are well worth it. You just have to remember that policies don't create standards, firm actions do. If you don't enforce the standards, they have no value.

RATING: *** — Defining standards is nice and simple, but you have to stick to your guns for it to pay off.

● Implement desktop management technologies.

Each trip to a user's PC costs you valuable time, but there's a limit to what you can talk a user through over the telephone. Several prod-

ucts provide electronic software distribution, check for viruses, collect inventory data and perform other chores. There's also remote-control software to take over a user's PC for troubleshooting.

If I could do only one thing to reduce TCO, it would be this. Imagine being able to deploy software, files and updates to each desktop without leaving your chair; finding and cleaning viruses before the user knows he has one; or remotely deleting files. Reduce visits to the users' desks, and you save incredible amounts of time and money.

But it isn't as simple as a flat tax. Besides the cost of the these packages (between \$45 and \$50 per PC), you also have to deploy them to each workstation and use them effectively. If you aren't fanatically meticulous in writing and testing the scripts for electronic software distribution, you can automate problem distribution as easily as problem resolution. Colleagues still remind me of the time I managed to shut down every user with my new "preventive maintenance" script.

RATING: **** — Like tax preparation software, desktop management software costs some money, and you must make the effort to use it effectively, but it can make life much easier.

● Limit users' abilities to get themselves in trouble.

The support needed for troubleshooting and fire-fighting when users download shareware or install games and applications they brought from home can be tremendous. Minimizing those risks, the gurus say, can reduce total cost of ownership. PCs without disk drives or CD-ROM drives are one way; strict rules about do-it-yourself installations are another, though they are less effective. Others put their hopes in the Windows NT operating system, which has built-in desktop controls.

I like this one's potential, but I'm hesitant about the implementation. The diskless workstation still hasn't really proved itself, and trying to control user activity through policy is generally futile. In the DOS/Windows 3.1 environment, desktops are vulnerable to users' ignorance, and Windows 95 isn't much better. In both environments, there's little to stop a user from installing his own software or changing application and operating system configuration files. To some of my users, it seems as if the most important application is their screen saver, and heaven forbid that you point to it as the source of their Windows resource problems.

I'm optimistic about NT's capabilities for letting me decide what users can (choose screen colors and wallpaper to their heart's content) and can't (edit the registry) do to their desktop. I also like the way NT lets me administer this control centrally.

But when I think of taking away user freedoms, I remember the uprising I ran into when moving from desktop printers to shared network printers.

I don't expect users to easily give up loading the screen saver du jour just because I ask.

RATING: ** — A little bit of knowledge can be dangerous, so we need to help protect users from themselves. But watch out for flying bricks.

● Maintain an inventory of all PC hardware and software.

If you already know what hardware and software a user has, the theory goes, then you won't have to spend time figuring it out when the user calls.

That's true, but do you really spend that much time on it to begin with? And I have yet to find a procedure or technique that will assure that members of the PC support team update the inventory when they upgrade a user from a 15-in. monitor to a 17-in. screen. There are several automated inventory tools, and combined with desktop management software, they're a good resource to have. But by itself, an inventory is lower on my to-do list.

RATING: * — I'll use the inventory if I have it because it helps answer unexpected questions about our PCs and printers from the chief information officer. But if it's done in isolation, I'm not sure of the overall value.

● Minimize hardware and software upgrades.

As soon as the deployment of one upgrade wraps up, plans already are starting for the next. You have to wonder if the benefits outweigh the costs. Anybody who can stop this merry-go-round deserves a nomination for the Nobel Prize in economics.

Hardware upgrades swallow resources like quicksand. It's generally much cheaper to buy that extra 8M bytes of RAM or a larger hard drive when buying the PC vs. upgrading later. Adding memory sounds easy, but it includes determining what part is compatible with the then-discontinued PC, then ordering it, installing it and hoping it works.

Similarly, you have to weigh an upgrade's value against the cost of deploying it. Your information systems resources are too limited to waste on delivering "enhancements" that few users, if any, need or notice.

Two downsides here: the additional capital outlay for hardware, and justifying to users why a particular software upgrade didn't warrant your attention.

RATING: ***

● Remember, knowledge is good.

The more you, your staff and your users know, the better off everyone is.

If your support staff thinks a "pivot table" is a monitor's tilt-swivel base instead of an advanced feature of Excel, or a user thinks the CD tray is a cup holder, you have a problem.

Solutions include training users and staff, product support contracted with vendors or third parties and access to knowledge bases, such as World Wide Web sites or CD-ROMs that contain information on products and technologies.

Training comes in many forms: classroom, computer-based, videos and more. But I think en-

environment training is often neglected. A few hours to familiarize new employees with your environment's idiosyncrasies (shared directories, ID/password policies, electronic mail, support channels, procedures, and so forth) brings them up to speed quickly and reduces support calls.

Unfortunately, training dollars make easy targets when budgets are scrutinized. But I'd cut back on training before giving up support arrangements for technologies that span the enterprise (network operating systems, network hardware and the like).

RATING: ★★ ★★ — The more information sources, the better.

● Management buy-in.

Because total cost of ownership issues affect the whole company, you should have support outside IS, and high up to increase the chances of success for your TCO reduction efforts.

Executive support is always nice if you can get it. But I don't know if I'd consider requiring it before embarking on TCO reduction efforts. More than once in my career I've brought things in without fanfare or on a shoestring budget because management didn't want to hear about it.

I think it's important that upper management be fully informed about TCO issues and efforts, but if experience is any indicator, once the talk turns to technology, their eyes glaze over.

In fairness, I get the same look when the bean counters start talking about things such as depreciation methods and cost-of-goods calculations.

The real untapped fortune is with user buy-in. Market your plans to users, get their enthusiasm up-front, and it'll really pave the road in front of you. But if you tell them IS knows what's best, you'll lose them.

RATING: ★ if you can get management buy-in; bbb for user buy-in; don't underestimate the value of users' support.

● Keep the infrastructure reliable.

Worrying about workstations without having a reliable network is like worrying about the quality of toilet paper on the Mir space station before repairing the oxygen supply. Network outages flood the help desk with calls, take down large groups of users and require virtually every member of your staff to drop what he's doing and scramble. On top of that, network outages might just be the fastest way to lose users' confidence and severely tarnish IS's reputation.

While on-call for a vacationing network manager, I learned another reason for maintaining a stable infrastructure: It reduces the 3 a.m. phone calls that make your network staffers question their career and employment choices.

Components of a reliable network come in many forms. Some are cheap and easy, such as running extra cables in your wiring closets or using that extra server as an emergency spare. Others are expensive, such as having multiple T1 lines.

RATING: ★★ ★★ — Don't worry about desktop TCO until you have a reliable infrastructure. That's

where the big savings are.

BOTTOM LINE

TCO reduction isn't a goal in itself. I think it's better viewed as a catalyst for driving the delivery of environment improvements. Those improvements should not only save money, but also should make IS and end users more effective.

Of course, how much you have to spend depends on the state of your shop. My network engineers have been able to maintain a 99.9% level of network availability, which means they get sleep, and I can focus my resources on other TCO solutions.

So from where I sit, there are plenty of ways to reduce TCO. But like most money-saving opportu-

nities, reducing it takes time — and probably some cash. After all, sometimes you may very well have to spend money to save money. □

Booth Bimbo

T

he more things change, the more they stay the same. And nowhere is that dichotomy more apparent than in comparing the women who will work the booths this week at Comdex/Fall '97 and the female IS managers who will attend the show. Talk about worlds colliding.

Female IS professionals have racked up impressive gains, breaking the glass ceiling and earning an average of 81 cents for every dollar their male IT counterparts make, according to Department of Labor statistics. And women are a common sight in IS departments; the Bureau of Labor Statistics estimates that women accounted for about 30% of the IS workforce last year.

But high tech isn't the only area in which the ranks of women are swelling. Scantly clad "booth bimbos," walking billboards for sexism, are also out in record numbers. Now, some may argue that that's only natural. This year's Comdex was expected to attract more than 2,100 exhibitors and about 160,000 attendees. The 33 modeling agencies in Las Vegas are booked solid. A random sampling of about six revealed that they were supplying from 20 to 120 women and men to work the booths and amble down the Comdex aisles in various states of dress and undress. Richard Weber, CEO of The Lenz Agency, which has been in business for 37 years, says models and showgirls who work Comdex can make \$200 to \$800 per day, not including tips. "And it's a fact that the more abbreviated the outfit, the bigger their tips are," Weber says.

But what type of impact does a blatant, in-your-face jiggle show have on professional women who have strived to erase the gender barriers in IS? Plenty, they say.

"The damage done by booth bimbos is immeasurable. They're on the edge of respectable," says Nora Miller, IS manager at the Northwestern Power Planning Council in Portland, Ore. "If professional IS women dressed like that, our male peers would think we were airheads. And if we dress too professionally, we're accused of trying to be like men."

Amy Bond, editor in chief and technology manager of the Women in Technology International World Wide Web site, agrees. "These women make it harder for the rest of us who are trying to be taken seriously. I've seen them in ragged bikinis, leaving little to the imagination. I support everyone's right to make a living, and

I've been unemployed in my time, but never that desperate," Bond says.

All of the female IS managers I spoke with wondered the same thing: What do their male counterparts think of these booth bimbos? Even Weber concedes that the free-wheeling atmosphere of Vegas and Comdex "can turn normally conservative churchgoing family men" into crazy conventioners who act like pubescent high school sophomores who do things they'd never dream of doing normally. At one Comdex show I attended, a minor league vendor got the bright idea of hiring booth bimbos outfitted in the skimpiest attire and adorned with twinkling lights to give attendees free shoeshines. Of course, the women had to bend over and kneel to do this. The drool factor was so high you'd never know Las Vegas was in the middle of the desert.

And how do the women who work the Comdex booths feel about their occupation? "It's honest work. It beats waiting tables, and the tips are phenomenal," said one named Aimee. "But it's incredibly sexist," I persisted. "Yeah, so what? Las Vegas is the capital of T & A."

"Don't you feel like you're setting the cause of women back a couple of hundred years?" I countered. "No way," Aimee said. "I also work as a showgirl, and if I'm such a bimbo, why are there so many professional women and housewives in the audience during a performance?"

Weber also distinguished between legitimate models and prostitutes who swarm Vegas during Comdex to work fourth-tier booths. "The vendors don't know these women are working for themselves. Once they solicit enough after-hours business, they don't show up anymore," Weber says. I tracked one of these women down and asked her if she didn't think her actions undermined women IS managers who attended the show. Tammi didn't see it that way. She says that despite the fact she can't tell the Internal Revenue Service how she earns her living, she's still got a lot in common with women IS managers. Tammi says she's a professional working woman, too. As if to underscore her liberation, Tammi said she's taken charge of her career. "I got rid of the pimp, didn't I?" □

Is this a great time, or what? :-)

MCI

et's ban the word "information." Of course, that would mean renaming IS, which may also be a step forward.

LET'S FOCUS ON ACTION, NOT INFO

PETER G. W. KEEN

"Information" is increasingly a misleading and even damaging term. It lies behind the continuing fallacies that have driven fads, overexpectations and underdelivery on promises. The following are the main ones:

- 1) **The information fallacy that almost destroyed the information systems field in the 1970s.** The IS department — note the title that had replaced data processing as the organizational label for the "computer department" — assumed that its growing data resources constituted an inventory of value to managers. Instead, it largely created a data bureaucracy.
- 2) **The knowledge fallacy that underlies many of the claims about the Internet, the Information Age, Information Society and the like.** Here, the assumption is that information equals knowledge. No way. If that were so, we wouldn't be facing a continued crisis in our education system. We are an information-rich society, but are we really knowledge-rich? Does the wealth of the Internet as an information cornucopia in itself translate into knowledge? Of course not, whatever the wider "net denizens" may hope.

The emergence of knowledge management and data warehousing engenders the next dangerous notion: that knowledge equals action.

All these fallacies come from thinking of information as a good in itself. IS looked at how to organize it. The Internet/intranet movement has worked to make it available. The data warehousing school makes it easy to access. They are all supply-side conceptions of the role of technology. They treat information as independent of people. Reading through about 400 articles and conference proceedings on data warehousing for a recent project, I was struck by how little they have to say about action — real people making real decisions to have real impact. They don't look at how those real people — not some abstraction we call "users" — become informed. Equally, there's plenty of talk in the groupware and workflow field about sharing information but relatively little about the reasons for sharing.

Most of the impacts of technology on the basics of business and competition have been less about information than about coordination of logistics and the movement of information: point of sale and quick response, for example.

ATMs, the exemplar of telecommunications in action, changed everyday life through service access; it's stretching matters to call this information technology. Data warehousing, a major step forward in enabling customer service, decision-making and planning, will succeed only if it pays attention to processes and people. Otherwise, all this new "knowledge" will sit in the warehouse unopened.

Think about your own firm. If a magic fairy instantly gave you absolutely all the information resources the company would ever need, do you think people would instantly know what to do with it and how to use it well? If not, why isn't education and support the largest part of your data warehousing budget?

Substitute for "information technology" a phrase such as "coordination technology," "business technology," "collaboration technology" or "learning technology" and you have a different focus — one that begins with people, not the information supply and its organization. In my readings on data warehousing, I felt my age. It was the decision-support systems (DSS) literature of the 1970s all over again. The DSS movement began with a strong focus on decision makers and decision processes; that's what made it the new mainstream. It lost that focus as PCs, spreadsheets and GUIs moved center stage. As a colleague who was a leader in the DSS field ruefully commented years later, we lost the "D" in DSS. The system, not decision and support, became the focus. The data warehousing and knowledge management fields are rediscovering too little and too late what the early DSS field knew: It's information use, not information supply, that we need to address and encourage.

Data supply doesn't create information. Information doesn't lead automatically to knowledge. Knowledge doesn't lead directly to action. Business action and impact are the goal. There's a distinct danger of the data warehousing and knowledge management fields overlooking this. Start with the people and their work, not the information.

Keen's first book was Decision Support Systems: An Organizational Perspective (1978). He is light-heartedly considering republishing it as Data Warehousing Systems. He can be contacted at peter@peterkeen.com.

Industry watch

Combating the skills shortage

How are some insurance companies handling the information systems skills shortage? Almost 20% of 80 firms surveyed by The Life Office Management Association, an Atlanta-based international association made up chiefly

of life and health insurance companies, are using referrals from their vendors to find qualified applicants. And more than 40% are developing nontrivial employment programs, often to work on year 2000 main-frame projects.

People over technology

Investing in IS professionals rather than technology apparently makes a bigger difference among U.S. retail banks. A study from The Wharton School at the University of Pennsylvania in Philadelphia — "Examining the Contribution of Information Technology Toward Productivity and Profitability in U.S. Retail Banking" — indicates that additional investment in IT capital may have no real marginal benefits and may be more of a strategic necessity to stay even with competitors. But investments in IT labor have a much higher payoff (nearly \$430 for every

dollar invested). Researchers also found that the more profitable banks put more emphasis on maintaining IT systems, had more in-house development of IT and less outsourcing and gave IT staffers more input in project selections and funding decisions of IT investments.

Spending up in health care

Health care IT budgets are growing. A survey of 231 health care chief information officers by the College of Healthcare Information Management Executives confirms growth in industry spending. Hospitals and integrated delivery systems dedicated an average of 5.4% of their overall budgets to IT in fiscal 1996, up from 4.8% in 1995. The average IS budget for provider organizations was \$7.5 million in 1995 and \$7.4 million in 1996. Survey respondents expect their budgets for this year to rise as well.

Buyer's Guide

MORPHING the PC MODEL

By Kevin **O**urden

ONLY A YEAR AGO, PC users driven by price bought direct from a vendor. If support was their main concern, they bought through a reseller. But the distinction between direct and indirect is clouded today, with each camp copying some of what makes the other so successful.

The dramatic shifts in the PC industry — the copycat strategies and the blurred boundaries between the vendors and resellers — have sent many buyers back to re-examine

what their vendor's competition has to offer, and often those buyers are finding many previous beliefs are no longer the truth.

Computerworld conducted in-depth interviews with a dozen PC managers at large organizations and a telephone survey of 152 other sites to identify the strengths and weaknesses of the competing PC acquisition models and to examine pricing and support trends.

Managers say support from direct vendors today appears more than adequate. At the same time, buyers say indirect vendors are advertising and

MORPHING the PC MODEL

CONTINUED FROM PAGE 101

negotiating more attractive prices than they did in the past. Still, preconceived notions may keep buyers from even investigating the options. Yet some of those ideas — highlighted below — may be myths, according to buyers.

"YOU KNOW WHAT YOU WILL GET FROM BIG-NAME VENDORS."

Inconsistency is a brief aired by users of the most prestigious PC companies as well as low-cost suppliers. For years, there has been a perception that name-brand vendors use known components and deliver similarly configured machines. Yet when buyers were asked why they changed vendors, they often said it was because their previous supplier, including name vendors, couldn't provide them with truly identical systems, even in a single order.

"We didn't expect to have this problem with Compaq [Computer Corp.]," says Norman Brideau, database administrator at Arbitration Forums, Inc. in Tampa, Fla. "But we've had several shipments of the same system with several different kinds of motherboards. It's ridiculous."

In addition, vendors that deal through indirect channels may have an additional concern when it comes to inconsistency. It's often the reseller, not the manufacturer, that controls the final product in those situations.

With inconsistency in system configuration, corporate information technology managers get headaches. Troubleshooting and upgrades are easier when you know the hardware you're dealing with, and there are always software and hardware compatibility issues to worry about if supposedly identical systems have different types of memory or BIOS.

Brideau did a bulk order of memory for a number of Compaq ProLiant systems of same model. His staff didn't realize they contained a variety of motherboards until he opened them up and discovered that some used parity single in-line memory modules (SIMMs) and others used nonparity SIMMs. "We were livid — it threw off our entire upgrade schedule," Brideau says. "It was supposed to take us three weeks, and when the CIO came down on week six, he wanted to know what the hell was going on down here."

Tom Milazzo, director of information

at the Kenan-Flagler Business School at the University of North Carolina at Chapel Hill, ran into problems when he went to upgrade a fleet of IBM ValuePoint PCs. When he saw the number of different memory types he was dealing with, and their unorthodox BIOS, he knew he had discovered one of the reasons his network crashed daily. "I can't expect to build an infrastructure that stands up if I can't control the quality of my desktops," he says.

Dell Computer Corp. was the only vendor praised by the interviewed users for being adept at building systems with absolute consistency. Milazzo, who has been buying from Dell for two years, says, "Each order comes exactly the way I want them, all alike, right down to the specific drivers for my network boards."

"YOU ALWAYS SAVE MONEY BY BUYING DIRECT."

Not necessarily. Yes, even with industry-wide price chopping, users say they can save at least \$500 per PC with direct vendors. Indirect vendors sometimes negotiate for lower prices, according to users and analysts, and even the direct vendor's \$500 price advantage doesn't translate into a pure savings. Some users argue that the additional services available to them through their resellers are worth more than \$500.

That wasn't the case for Compaq customer Jeff Collins, IT manager at Dynasty Technologies, Inc. in Kingwood, Texas. He recently purchased systems from Gateway 2000, Inc. and says he received no more, and no less, support from Gateway than from Compaq. He estimates \$350 worth of his staff's labor goes into setting up each system. "We were doing the exact same thing when we bought from Compaq," he says.

With margins so low, "reseller support is almost nonexistent," says Michael Lind, PC support manager at Tredgar Industries, Inc. in Richmond, Va., who has been buying Compaq systems from his reseller, MicroSystems Warehouse in Lakewood, N.J., for the past three years. "I get most of my support directly through Compaq," he says.

Lind says he is mostly paying his reseller to help him stay ahead of the market. "I don't want to worry about configuring with the latest hardware or software. That's the value I look for." He may be typical of corporate managers in that he uses only a limited amount of the support for which he pays.

Dell systems come with one year of

on-site support; three years of on-site service costs \$500 per system, according to Cheri Bowers, PC support manager at Bryan Memorial Hospital in Lincoln, Neb. "And since we estimate a 20% savings per system [by buying direct], of course we're saving money," she says of the \$500 option. Yet, her group calls Dell only when warranted components fail or when Dell technicians can fix a system faster than her staff can. Bowers says her staff installs and configures the software on each system, except for the operating system and office products that are installed by Dell, and sets up each system on users' desktops.

"INDIRECT CHANNELS MEAN BETTER SUPPORT."

That depends on how much support you need. If you are intent on doing your own install, memory upgrades and drive replacements, and your IS team is large enough to support your user base, direct vendors may deliver all the basic support you need. However, a direct vendor would never cut it for someone like Dale Cochrane, PC service manager at Humana Insurance Co. in Green Bay, Wis. He has 1,400 PCs and an in-house

amount of support he used from Visstar Corp., his Compaq and IBM systems reseller; he decided it didn't make sense to pay for what he wasn't using. "Telephone support was about all we used," he says.

"IT'S BEST TO STICK WITH YOUR CURRENT VENDOR."

Users interviewed here say it's true. No matter how good the deal appears with other vendors, users say the relationships they have built with their vendors are worth much more than any short-term perk.

Although vendors are always trumping each others' value, price cuts and additional services are only good until the rest of the market follows suit. But a good vendor, relationship — one in which your sales representatives know you, your business and the equipment you already have — takes time to develop, and users say it shouldn't be thrown away to save a buck.

Cochrane has certainly had troubles with his reseller, and with a \$200 million annual budget, he has a lot of vendors vying for his business. "I can't say I haven't been tempted by a few of the others," he says. "But cost is not a big issue for us. Having a strong relationship with our reseller is."

Bowers is another who says she knows better than to be tempted by what may appear to be a better deal. "I wouldn't sacrifice the history I built with Dell for anything, particularly price," she says. Dell has catalogued every system Bowers

has bought. "I give them the service tag numbers, and they know exactly what's in the machine and how it's configured," she says.

To get the most out of the relationship, users say it's important to learn the breadth of services vendors offer.

There is a tendency to view direct vendors such as Dell and Gateway as mass marketers of low-end PCs. "They sometimes have trouble articulating all they offer," Milazzo says.

And, although time can strengthen relationships, none is required to build one. "It's all about good communication," Cochrane says. Being totally honest from the start is the best advice users say they can give for quickly building relationships that work for everyone. Air all your expectations of the vendor as soon as possible, particularly about service and system availability. "There are can sour any relationship if you're not on the same page," Cochrane says. □

Burden is Computerworld's feature writer, Buyer's Guide.

A good vendor relationship takes time to develop, and users say it shouldn't be thrown away to save a buck.

support staff of 15.

Cochrane says his reseller earns every cent supporting Humana. MicroAge technicians come by twice a week to pick up Hewlett-Packard

Co. systems covered under warranty, he says. "I can't afford to have my people calling vendors all the time."

Then there are users like John Mazzella, information systems manager at Commonwealth Scientific Corp. in Alexandria, Va. He stopped buying Compaq systems because he didn't want to ship them out to be fixed. He wants a single point of contact at the vendor to explain the problem and to have parts delivered the next day. "Gateway does this. That's all I need," he says. "I'm paying very competent technicians on my staff. Money going to a VAR would be like paying double."

A year ago, the scare of inadequate support was all that was holding Brideau from buying Dell or Gateway systems. But once he had totaled up

SNEAK PEEK: Power, pricing and production in '98

By James M. Connolly

The funny thing about the PC industry is that no matter how turbulent today seems, you'll look back a year from now and think these were the sane times. The craziness just doesn't end.

The coming months will bring faster, cheaper PCs with new options and vendors grasping for the best way to sell, just like 1997. Some of the turmoil stems from causes information technology managers have come to accept. Faster chips give you more bang for the same buck you spent the year before, and new technologies — such as Universal Serial Bus and Accelerated Graphics Port (AGP) cards in 1998 — will boost overall system performance.

Where things get really confusing for IT managers is in the purchase process. Prices tumbled in 1997, and the buying model was recast as buyers re-examined the direct vs. indirect argument and more vendors embarked on build-to-order manufacturing. Price cuts and build-to-order strategies will continue to be hot in 1998, according to analysts.

The average price of a corporate PC will continue to slide in the coming year, according to analyst Chris Goodhue, vice president of end-user computing at Gartner Group, Inc. in Stamford, Conn.

"Intel and the OEMs are being really aggressive on Pentium II rollouts, and those Pentium IIs are falling right into the pricing sweet spots," Goodhue says. Bargains still can be found in traditional Pentium machines. "Maybe customers can save money by not rushing out to buy the latest. I think Pentiums will be viable through most of 1998, or at least the middle of '98."

For many types of users, a Pentium may be fine at this point, as long as it has enough memory although the Pentium II may be a good investment based on their attractive pricing and the fact that the architecture will be around for a while.

Both Goodhue and Rob Enderle, senior analyst at Giga Information Group in Santa Clara, Calif., raise red flags for buyers looking at the sub-\$1,000 PCs that caught so much public attention in 1997.

Enderle has seen some corporate interest in those low-end systems, but he advises IT managers to weigh the low

price against the labor costs involved with replacing the computers a year earlier than they might have to with mid-range machines.

Goodhue says although the sub-\$1,000 PC is worth considering, buyers must keep in mind that the system seldom includes a monitor, and the published price might only buy older technology, such as a 133-MHz Pentium or a nonstandard design.

One reason prices are falling is because vendors are changing how they do business. With build-to-order strategies, vendors assemble PCs only after a customer looks an order. Vendors aren't stuck with large inventories of preconfigured PCs, and buyers can better customize their systems.

Build-to-order strategies and the ongoing price cuts are largely a result of IBM, Hewlett-Packard Co. and Compaq Computer Corp. reacting to the success of lower cost, direct vendor

ing to ramp up, and there could be problems. It's worth understanding things such as who is going to assemble my product and what assurances I have on availability."

Enderle offers two pieces of advice for IT managers. First, when dealing with build-to-order strategies, be aware that your system — particularly less common components — may not have been tested as thoroughly as a standard configuration. Second, he says, "Buy big. Be important to your vendor, and then if you have a support problem, they will treat you a lot better."

One of the most important technology developments Enderle sees coming involves system management.

"We're looking for a set of equipment that is much more easily managed from a central site," he says. The person doing the central management might be part of an IT organization running preventive maintenance after office hours or a vendor downloading a software fix.

A key to easier management is that most major vendors are starting to ship Desktop Management Interface (DMI) 2.0-compliant PCs. Managers formerly used DMI 1.0 largely to collect inventory information on PCs and to make limited changes. Now, with DMI 2.0, those managers will get a better interface and the ability to make significant changes to a system, such as modifying the BIOS and formatting a hard disk from a central location, Enderle says.

User sizes will also benefit from vendors making PCs that boot up faster. "The advantage it provides to the IT manager is that if they have to turn on the machine remotely, they won't have to wait for the machine to start, and that translates into labor savings," Enderle says.

Another technology that analysts agree will be hot in '98 is AGP, which offloads graphics processing from the CPU to a special bus, resulting in faster overall system throughput.

Users can expect a flood of peripherals based on the Universal Serial Bus architecture starting at Comdex/Fall '97, with digital cameras for still images and videoconferencing being particularly hot in 1998. □

Connolly is Computerworld's technology evaluation editor.

ALL THE TALK ABOUT PC PRICE CUTS TRANSLATES INTO A 13% SAVINGS FOR BUYERS

BY KEVIN BURDEN

Price cuts — How much of what's promised will you actually see, and what other ingenious ways will vendors think of to make up for those cuts by sticking it to you? You might be a bit skeptical of the hype vendors cast to get your attention, but the PC market is showing some credibility here.

A telephone survey of 524 corporate PC buyers shows users are getting very close to what vendors promise. Computerworld's Information Management Group asked those users what they would realistically expect to negotiate

from a vendor that announces a 15% list price cut. Nearly half are confident they would get the full 15%. The average is just under 14%. But enough of the hypothetical.

Ninety percent of the users say they are paying an average of 15% less for systems than they were six months ago.

But the cynic in most of us says vendors are surely sucking it to us in other ways. No, 60% of those users say.

And the 40% who have seen these savings offset by vendors say it's only because they are buying more advanced PCs for the same cash. "The size of the check I write is no different. But I'm seeing more bang in the systems I'm buying," says John Barryhill, systems administrator at AutoGass Systems, Inc.

Eighty percent of the respondents say their typical users are getting better systems than they are on, and 64% say more advanced systems will go to their high-end users.

However, price cuts haven't persuaded users to buy more services or to shop for vendors with the best price. Only 9% say they are paying extra cash for extended service plans. And more than 60% say there isn't any reason to change vendors, with many of those buyers noting that all vendors have lowered prices equally.

The coming months will bring faster, cheaper PCs with new options.

Dell Computer Corp. And those companies will put still more competitive pressure on Dell in the future, according to Goodhue.

"To be honest, I don't see the No. 1 driver in the choice of a vendor to be direct or indirect. Very simply, it's price. Dell enjoys today, and has enjoyed for some time, a 10% to 15% price advantage. At the end of the day Dell is on the short list because they are putting price pressure on other vendors," Goodhue notes.

Goodhue says IT managers must be aware of how changes in the industry will impact them and how they will change their relationships with PC manufacturers. "Overall, these initiatives are going to be good news for customers because they are going to result in lower prices," Goodhue says. "However, in the near term, some of the build-to-order programs and channel assembly programs are just start-

that's unique after
extremely rare

REVIEW: PC vendor Web sites offer flexibility and convenience for buyers doing research and placing orders

By Thomas Lamoureux

As an information systems manager, I've been hearing about commerce on the Internet for quite some time, but I questioned whether there was any extra value in purchasing computer equipment online. After trying out four PC vendors' online buying sites, I realized that, yes, there are some definite advantages over conventional telephone sales.

Online purchasing offers choice and flexibility you just don't find in dealing with telephone sales representatives. You get to spend as much time as you want comparing products from competing vendors, pricing the options, reviewing the wealth of product specifications and, in most cases, placing an order. And you can do all of this when it's convenient for you, not just when it is convenient for your vendor.

You don't have to wait on hold, you never have an inexperienced sales repre-

sentative, and when was the last time you dealt with a cranky Web site?

I visited each site I reviewed as would a typical corporate buyer — someone who knows what type of machine he wants but would need to look through each vendor's product line to identify the model that most closely fits his need. I did research to find the right model, worked through the online configuration process to specify the options I wanted, determined the price and then walked through the ordering process. I looked at the quantity and quality of product information, the variety of options available in the online configuration process, the ease and completeness of the order process and how close the vendor could get to the desired configuration.

I set out to shop for a high-end desktop for a power user. I wanted an Intel Corp. Pentium III-based machine running at 266 MHz with 64M bytes of random access memory, a monitor with at least 64M bytes of video RAM, a 27-in. monitor, a 9G-byte SCSI-based hard drive, an Imega Corp. Jaz drive for offline storage, a Microflop Corp. Network card, a 10/100M bit/sec. network card. I didn't specify name brands

for the video card, hard drive or monitor as long as the products used could be identified as mainstream products.

Because the configuration was pretty basic, all of the vendors were able to deliver my power machine with the exception of the Jaz drive. None had a Jaz drive as an option, though most had Imega Zip drives.

The SCSI selection was fairly consistent, with each vendor offering the Seagate Technology, Inc. 9G-byte hard drive and an Adaptec, Inc. 2940 controller. Monitors ranged from name brand to vendor brand, and most vendors had ample selections. One surprise was that Dell Computer Corp. didn't offer the Natural keyboard in its online configuration forms. I could order a Natural keyboard, but only after drilling a few letters to the accessories page.

Among the sites reviewed, Dell had the best overall presence, with Micron Technology, Inc. a close second. Dell's site provides a lot of information and is

With electronic commerce emerging, the expectation is that we'll all be making our purchases online in the very near future.

very well-organized. Dell also provides the most options in configuration and order entry, and it was

the only site I visited that offers the ability to review orders. Micron has ample online information and offers a wide range of features in configuration and order placement. Although it doesn't offer for an order review, Micron uses online technology to make its sales staff available. Gateway 2000, Inc.'s site offers good product information, but it was the hardest to work through. It offers more model numbers with slightly varying configurations but offers the fewest options when configuring the machine. ☐

Lamoureux is director of support services in Computerworld's systems department.

DELL COMPUTER CORP. (Best overall presence)
www.dell.com

RESEARCH

When you enter the Dell site, you are given three ways to proceed. You can review product information by going directly to that type of product (for example, desktop or workstation), drill down to customized configurations by type of business (for example, home or business), or go directly to the online purchase menu and, within two clicks, arrive at the configuration screen. The online information presented at the Dell site is simple and well-organized.

Dell also provides suggested configurations to allow you to determine the optimal configuration for a given type of user (for computer use). There are, however, places where the information is sketchy, such as the workstation specifications, which never mention that the workstation contains an integrated network card.

CONFIGURATION

The online configuration screen, in addition to allowing the full range of options, provides configuration cross-checks, both as "online hints" and under the options themselves. For example, it suggests that an integrated drive electronics-based CD-ROM drive is compatible with a SCSI hard disk only when Windows NT is chosen as the default operating system. Although not complete — it allowed mismatched processors and memory modules exceeding the number of available slots — the error-checking was far better than any other site reviewed. In the configuration process, the only confusion came when the online configuration screen mentioned an option for additional network cards. Unfortunately, I wasn't told that the model included an integrated network card, and in my first pass, I assumed this was where I could choose the primary network card. It wasn't until I reviewed the suggested configurations that I realized the workstation came with an integrated network card.

PURCHASING

Once you choose the configuration, you can place the selected machine in a "shopping cart," which lets you configure and purchase additional machines. When your selections are complete, you can go back to review individual items or place the order for "Checkout," as Dell calls it. If you choose Checkout, you are prompted with a secure form requesting bill-to and ship-to contact information, demographics on your organization, your choice of delivery options and freight carrier and the method of payment. Dell even

lets you enter special shipping instructions.

SUMMARY

The Dell site was very well-organized, making it equally suited to those who are familiar with its product line and those who aren't. It provided the best online documentation of the sites I reviewed, as well as very good product options and a solid, full-featured order-entry process. Dell was the only site that offered the ability to place multiple configurations in one order and provided an online order-review process. Aside from the network card problem, it was easy to work through this site. It provided the most flexibility and was the most enjoyable site I visited. From an "online experience" standpoint, Dell's site was second to none.

MICRON TECHNOLOGY, INC. (A close second)
www.micron.com

RESEARCH

When you enter Micron's site, there are two ways to proceed. You can either drill down by specific purchase types (home or small business) or specific product lines (such as workstation or portable). Although there are only two purchase type options (home and small business), each is complete, with good descriptions of the individual product lines and features. When drilling down to the product lines, you are presented with a list of the specific models under that product line. Each model has a brief de-

IS goes shopping, page 106

PRACTICING**

Just Code the Cool Stuff

www.synon.com

CONTINUED FROM PAGE 106

scription of the features. Once you select a specific model, you receive a more detailed description and a list of options. You also have the choice of reviewing the model specifications. The information presented is simple, though it isn't as clear and well-organized as the other sites reviewed.

CONFIGURATION

Once you have chosen the model you wish to configure, you can proceed to the "Build and Buy" configuration screen. The configuration screen doesn't contain error validation and thus allows you to enter invalid configurations. Also, the model choice contains the processor speed. Once you get into the configuration screen, you're no longer allowed to change the processor. Another configuration option that isn't clear is that certain models (the Powerline models) come only with Windows NT, while desktop models allow the choice of Windows 95 or Windows NT. Generally, there are many configuration choices for each of the given options and each of the options is clearly described.

PURCHASING

Once you have selected the options and calculated the system price, you are given two choices. You can request more information about your configuration or you can place your order. Order placement allows the entry of ship-to and bill-to contact information,

company demographics, payment information and special instructions. Payment type contains credit-card information only—purchase orders or company checks aren't allowed as payment options. One procedure Micron adds to the buying process is that the order isn't accepted until it's processed by a sales rep. It surprised me that the other sites didn't do the same. The payment options are limited, but the order process allows the collection of all the pertinent information. Although there are no references to the expected amount of time for a sales representative to call or average delivery information, Micron was the only site verified to provide an "information request" function.

SUMMARY

Micron's site contained enough information to make an informed purchase. The configuration options were among the best, and the addition of the order and information request screens made the process complete. Information wasn't organized as clearly as it was at other sites; when you choose a configuration, you have to back out if you realize the chosen model lacks features you desire. A feature being tested on the Micron site allows the online buyer to contact the Micron sales department either by an interactive chat session or using Microsoft Corp.'s NetMeeting. This feature was still in a beta state, but I didn't find it at any other reviewed site, and it may

give Micron another method to provide solid presales customer support.

COMPUSA, INC. (Reasonably complete)
www.compusa.com

RESEARCH

Although it isn't a first-tier direct sales computer manufacturer, CompUSA is moving in the direction of online sales and has its own custom-configured brand. CompUSA has only two main product lines (most other vendors have four to six), so the selection is fairly limited. On the other hand, one advantage is the way the site is set up: It provides concise descriptions of the two lines and then allows you to drill down by selecting the processor type and then working to the options screen. Of the sites reviewed, this was the easiest on which to determine the desired model and then configure it.

CONFIGURATION

The "Online Configurator" is CompUSA's custom configuration model. It shows the two discrete models—the American and the American PRO—and provides brief descriptions of each and then prompts you to choose a processor for a given model. Once you choose the model/processor combination, you see the configuration screen. On this screen, all configuration options are accessible, with the exception of the processor. As with most sites, it displays the base price prior to making configuration changes.

CompUSA hasn't attempted to build validation logic into the Online Configurator and thus allows a buyer to make such invalid choices as selecting a SCSI hard drive without choosing a SCSI controller. Again, this seemed to be the norm across most of the sites reviewed.

PURCHASING

Once your machine is configured, the next choice with CompUSA's site is to process the order. First you are asked to review a list of the options you chose. If you have already registered with CompUSA, you can place the order. If you haven't registered, you can register by providing street address, telephone number, fax number and electronic-mail information, along with the selected password. Once registered, you confirm the shipping and billing information through CompUSA's secure site and then complete the order. The site claims the company will build and ship within 10 days.

SUMMARY

The CompUSA site was reasonably complete. Although the product lines are fairly limited and don't provide a mechanism to contact sales or inquire about availability, this site makes up for its shortcomings with concise presentation of background information and a straightforward order process.

GATEWAY 2000, INC.
(Hardest site to work through)
www.gateway.com

RESEARCH

Entering the Gateway site, you are presented with two options. You can drill down to preselected product models, or you can choose the type of purchase you wish to make (for example, business or home computer). By choosing purchase type, you are presented with the product models most applicable. In the case of a corporate purchase, for example, the preselected categories are network-ready computers, servers and peripherals.

Each choice presents slightly different models, but for each model shown, there is a checklist of standard options, which makes it easy to choose the appropriate model.

CONFIGURATION

Once you've chosen the model you want, you can view more information about the model, including detailed product specifications, product benchmarks or reviews, or you can proceed to the configuration stage. In the configuration screen, each model is listed with a base price.

Rather than provide a broad range of options at the configuration level, Gateway offers multiple models and configurations for each processor type and then limits options in the configuration screen. This was confusing because, on my first pass, I chose

business purchase, network-ready PCs and what seemed to be the highest-end workstation. Then I found out I couldn't specify Windows 95 or deselect the Intel Corp. LANDesk client software, so I had to go back and choose a different model before I could get the options I wanted.

ORDERING

After the configuration process was complete, I chose the "buy" option, expecting to either register and specify the shipping and billing information or to be presented with a way to forward my order to a sales rep to confirm the details. Unfortunately, after choosing the "buy" option, I was presented with a recap of the order, a quote number and instructions to attach a printed copy of the quote with the purchase order. This was a rather disappointing end to one of the more difficult online configuration processes reviewed.

SUMMARY

The organization of the home page provided the best set of choices, but subsequent levels were more confusing. They provide too many configurations from which to choose and only limited options for each. The purchase process (or lack thereof) seemed to be sadly consistent with the way the remainder of the site was organized. Overall, Gateway's site was disappointing.

Microsoft is learning to make its voice heard in Washington — and Washington is all ears

the GAME

MICROSOFT CORP.'s Washington lobbying office isn't exactly smack dab in the corridors of federal power. In fact, the software giant's operation, located in the Chevy Chase Pavilion Shops mall, barely lies inside the bounds of the District of Columbia.

But don't let the hideaway locale fool you. Microsoft intends to be a force in U.S. politics. In less than two years, Microsoft has spent more than \$2 million on professional lobbyists and campaign contributions. And that sum, which comes from disclosure forms filed with the U.S. House of Representatives and U.S. Senate, doesn't include political fund-raisers or software donations.

Of course, Microsoft certainly isn't alone in

playing politics. The \$11 billion Redmond, Wash.-based company isn't even the biggest lobbying spender among computer industry vendors — Washington graybeard and antitrust veteran IBM is.

But Microsoft has learned well how to work Washington.

Several recent laws and policies make Microsoft's \$2 million investment look like a bargain:

- The extension of the Research and Development Tax Credit. Alongside other large technology companies, Microsoft fought tooth and nail for this tax break on any R&D spending over a base amount.

By Kim S. Nash and Carol Silwa

How a law becomes a Bill

1990

EARLY 1990. Federal Trade Commission (FTC) antitrust investigation starts to look at Microsoft because of an agreement it signed with IBM regarding DOS and OS/2. The pact was announced at Comdex.

Microsoft hires Bill Gates' father's law firm, Preston Gates Ellis & Rouvelas Meeds, as counsel in Washington.

1992

Microsoft creates its own political action committee (PAC), which gives \$22.250 to federal candidates and registered committees in 1990-92 election cycle.

EARLY OCTOBER. Steve Ballmer, Microsoft's No. 2 executive, introduces Vice President Al Gore at a fund-raiser; Ballmer, a Harvard University buddy of Gore's, gives \$2,000 to the Clinton/Gore campaign.

OCT. 26. Ballmer writes a letter to software executives in the Pacific Northwest urging them to support Clinton/Gore.

NOVEMBER. Gates votes for Clinton/Gore ticket.

DECEMBER. The FTC files a 250-page report that recommends a court injunction against

Microsoft; it alleges the company practiced unfair business tactics.

1993

EARLY JANUARY. Microsoft cosponsors a Washington reception for Speaker of the House Tom Foley (D-Wash.).

FEBRUARY. After several days of intense lobbying by Microsoft rivals, including Provo, Utah-based Novell, Inc., the FTC votes on whether to take action; it deadlines at 2 a.

SUMMER. Gates flies to Washington to lobby FTC commissioners.

EARLY JULY. Sen. Howard Metzenbaum (D-Ohio) writes a letter to FTC Commissioner Janet Steiger, an appointee of George Bush, urging that the FTC turn the case over to the U.S. Department of Justice if another deadline occurs. Sen. Orrin Hatch (R-Utah) writes a similar letter.

WEEK OF JULY 15. Gates visits all four voting FTC commissioners.

JULY 21. The FTC deadlines 2-a again on whether to take action against Microsoft.

JULY 28. The Justice Department asks to see the FTC's Microsoft files. (Experts say it is unusual for the Justice Department to pick up an antitrust case the FTC has rejected.)

JULY 29. The Justice Department receives the FTC's Microsoft files and takes over the investigation.

1994

In the 1993-94 election cycle, Microsoft and its PAC give \$42,741 to federal parties and candidates.

JULY. The Department of Justice submits a consent decree to Judge Stanley Sporkin, who spends most of the next year criticizing it; he ultimately rejects it (see August 1995).

Playing the GAME

CONTINUED FROM PAGE 108

•The Foreign Sales Corp. provision, which lets companies take a 15% tax break on profits generated outside the U.S.

•The Clinton administration interceded in a dispute with the U.S. military and smoothed the way for the Federal Communications Commission to grant Bill Gates and partner Craig McCaw a worldwide radio frequency license for satellites.

Microsoft shares many of its lobbying successes, such as the tax breaks mentioned

Where the MO

Like any major corporation, Microsoft has a vast network of causes in many countries. In some cases, the company's political action committee (PAC) has joined with other business groups to lobby for legislation. In others, the company has used its own resources to influence the legislative process. The company's PAC has also been used to support candidates for office who are sympathetic to its interests.

Taxes

No one likes to pay taxes. But while you may have indulged in some leeching and Pepto-Bismol in April, Microsoft hired top lobbying firms this year and lost to fight the tax man on several fronts. Four of those firms did nothing but tax work — either landing advice or trying to convince the House, Senate, Department of Treasury and Department of Commerce that Microsoft should get a better deal.

It worked.

Microsoft, with hundreds of other technology companies, fought hard to get an extension of the Research and Development Tax Credit. That's where Congress lets companies take up to a 20% tax break on any R&D spending over a particular base amount, which is calculated using the company's previous R&D rates.

Some call it corporate welfare. The federal Office of Technology Assessment has found that mostly big companies — and not struggling start-ups — have benefited from the credit.

But Microsoft, which has \$9 billion in the bank, got its wish. An extension of the credit was included in the Balanced Budget Act of 1997 that President Clinton signed Aug. 5.

Elsewhere, Microsoft spent big on lobbying to get tax protection on sales made outside the U.S. The so-called Foreign Sales Corporation (FSC) provision essentially lets companies take a 15% tax break

on profits generated outside the U.S. Rep. Jennifer Dunn (R-Wash.) cosponsored the proposal with Rep. Robert Matsui (D-Calif.).

Until this summer, it was unclear whether software companies could form FSCs. But Dunn's bill passed, and Microsoft FSC Corp. in the U.S. Virgin Islands became legitimate. Had the law been in effect during Microsoft's 1995 fiscal year, the company could, in theory, have paid 15% less in federal taxes on the \$1.48 billion in operating profit that came from beyond U.S. soil.

"That could easily be millions of dollars saved," said Robert Rees, president of the FSC/CHSC Tax Association in White Plains, N.Y.

Microsoft also filed a suit in U.S. Tax Court in August 1996 claiming it was overtaxed by \$10 million in 1990 and 1991. The case is still pending. Hey, with a 1997 U.S. tax bill of \$1.1 billion, every bit helps.

But if you've ever been audited, take heart: The Internal Revenue Service is examining Microsoft's tax returns for 1990, 1991 and 1994, according to the first print in Microsoft's 1997 annual report.

Antitrust

The U.S. Department of Justice asked a federal court last month to fine Microsoft \$1 million for every day it compels PC vendors to bundle its Internet Explorer browser with the Windows operating

above, with other computer industry vendors. And compared with the lobbying heavyweights from, for example, the tobacco and automobile industries and organized labor, the company is thrifty (see story page 112).

But Microsoft, already a dominant force in the high-technology sector, is spreading its influence to industries such as telecommunications, electronic media and the Internet. Indeed, Microsoft ranks with the most powerful companies in the world.

Intellectual property, encryption and trade issues are top priorities, according to Jack Krumholz, Microsoft's lead lobbyist in Washington. The vendor, for example, wants stronger protections written into copyright laws.

On encryption, Microsoft wants to loosen laws banning the shipment of products with strong cryptography.

Yet there is another big reason Microsoft wants to become Washington-savvy: antitrust.

Microsoft's presence in the nation's capital has grown from slouch at the beginning of this decade. Then again, the company has arrived fashionably late at many a technology party only to go on to dominate.

Will politics be just another operating system war? □

Nash and Silvers are Computerworld senior editors. Their Internet addresses are kim_nash@cw.com and carol_silvers@cw.com.

NEY goes

system that gets preinstalled on their hardware.

The Federal Trade Commission (FTC) has also expressed interest in Microsoft's browser marketing tactics, as have the attorneys general in six states, the Barnett Commission and Japan's Fair Trade Commission.

These investigations have so far changed little about how Microsoft does business. However, Microsoft isn't waiting until the current probes grow legs.

Kimberly Elvanger, hired by Microsoft in 1994, and Jack Krumholz — both lawyers with public policy expertise — are among the lobbyists entrusted with the chore of convincing Congress and other Capitol Hill politicians.

Indeed, of all the lobbying money Microsoft spends, one of the biggest chunks goes to Elvanger, Krumholz and their six lobbyist colleagues. The team, which handles other issues as well, has drawn \$140,000 as of June, according to disclosure forms filed in the House and Senate. Last year, it got \$258,000. That seems like short money when the alternative is to put a million bucks in Janet Reno's parking meter every day.

Krumholz said he "focuses primarily" on other issues but does get involved when questions about software competition arise.

International relations

With 40%, or \$4.53 billion, of its \$11.36 billion in sales last year generated outside the U.S., foreign trade is a big deal to Microsoft. To ensure it stays that way, Bill Gates has traveled the globe in the past several months. He met last month with world leaders in the

U.K., Germany, Russia and Switzerland. In June he was in Japan and Korea. And in March he was in India, where Gates was hailed as a celebrity. (Of course, it's not unusual for corporate titans of all stripes to do a fair amount of globe-trotting.) But with Gates, it's a media event at almost every stop.

Here's a sampling of other international dealings.

China. When the question arose early this year of whether the U.S. should renew Most Favored Nation trading status for China, Microsoft handed the project to Gates' father's Washington law firm, Preston Gates Ellis & Boudreau Meade. Like other lobbyists, hustled to keep the massive — and growing — market open for U.S. products.

Brazil. The Business Software Alliance (BSA) recently did some of Microsoft's bidding. In May, the trade group sent a representative to help hammer out the intellectual property provisions in the Free Trade Area for the Americas (FTAA) pact that President Clinton crossed Latin and South America to promote this fall. FTAA would lower tariffs for companies doing business in the 34 countries involved — sort of a super-size North American Free Trade Agreement.

Companies from other industries were there, too. But the large Microsoft contingent caught the attention of James Love, director of Ralph Nader's Consumer Project on Technology.

"I didn't see another American software company in the room," Love says. By the way, no one will reveal how much of the BSA's \$20 million budget Microsoft contributes, but it is said to be the majority. Critics contend that the BSA is little more than a mouthpiece for Microsoft — a charge vehemently denied by Robert Holzman, BSA's director.

— Kim S. Nash and Carol Silvers

AUGUST. Gates and President Bill Clinton golf on Martha's Vineyard.

1995

Nathan Myhrvold, Microsoft's chief technology officer, is assigned to study "how Washington works."

SPRING. Microsoft opens a Washington lobbying office and hires Jack Krumholz.

APRIL. Microsoft drops proposed acquisition of Intuit, Inc. after the Justice Department files suit to nix the deal.

AUGUST. The Department of Justice concludes investigation of Microsoft with a consent decree that critics deride as a writ-off. (History: The decree was originally proposed in July 1994 but was rejected by Judge Sporkin.) The Justice Department and Microsoft protest that Sporkin should be removed from the case; he is. The decree is assigned to Judge Thomas Penfield Jackson.

FALL. Microsoft hires a second lobbying firm: Downey, Chandler, founded by former Rep. Thomas Downey (D-N.Y.) and Rod Chandler, former Republican congressman from Washington state.

NOVEMBER. After they heavily lobby lawmakers in several countries, Gates and Teledec partner Craig McCaw overcome one hurdle in a plan for a global satellite network: An international body identifies a special band of radio spectrum for use by companies planning such networks.

1996

For the year, Microsoft pays \$1,400,000 to lobbyists.

In 1995-96 election cycle, Microsoft and its PAC give \$126,600 to federally registered committees and candidates. That's almost three times the amount it spent leading up to the 1994 election and more than five times greater than the 1992 election.

Microsoft helps fund a dinner for First Lady Hillary Rodham Clinton in Seattle and annual Republican House and Senate gala dinners in Washington.

MID-1994. Microsoft hires Grover Norquist as another outside lobbyist. He is a conservative who specializes in tax issues and is said to be close to House Speaker Newt Gingrich and other Republicans.

LATE JULY. Microsoft joins Apple, Intel, Compaq, Dreamworks, the Directors Guild of America and the International Photographers Guild in a new lobbying organization called Americans for Better Digital TV.

SEPTEMBER. The Justice Department starts examining Microsoft's browser practices.

Microsoft donates software to both major parties for their conventions.

DECEMBER. Gates is floated as possible participant in Clinton's inaugural festivities. He doesn't participate.

1997

JANUARY - JUNE. Microsoft pays \$660,000 to outside lobbyists for Washington work.

How a law becomes a Bill

CONTINUED FROM PAGE 111

MARCH 14. The FCC grants Gates and McCaw a worldwide license for a specific radio frequency needed to advance their plan to launch \$40 low-orbit satellites to circle the globe. The Clinton administration helps navigate a dispute among Gates/McCaw and the U.S. military and Associated Communications LLC, a wireless company.

MAY 8 • 9. A Microsoft-sponsored CEO summit takes place at Gates' house. Attendees include FCC Chairman Reed Hundt, Al Gore and 1996 presidential candidate Steve Forbes.

EARLY JUNE. Gates goes to Washington with nine other software CEOs, meets with Gore, Commerce Secretary William Daley and lawmakers to talk about software industry issues, including copyright reform, immigration and satellite communications.

JULY. The Clinton tax bill includes a big tax cut for software companies, from which Microsoft will benefit the most.

JULY 30. Gates speaks to the National Governors' Association in Las Vegas about how much better computer systems would make state government.

As of September, Microsoft and its PAC give \$44,000 to federal party committees and candidates.

SEPT. 12. Microsoft holds a policy briefing in Washington to outline its stances on major issues before Congress and tries to dispel the notion that the company is competing unfairly in the browser market.

SEPT. 30. Microsoft releases Internet Explorer 4.0, a version of its Web browser that the company claims is integrated with the Windows operating system. The product will be at the center of a Justice Department inquiry a few weeks later.

OCT. 6. Gates tells Gartner Group Symposium audience that Justice Department antitrust scrutiny has forced the company to rethink its acquisitions strategy and that Microsoft will now buy only smaller companies or invest in larger ones.

OCT. 20. The Justice Department and Attorney General Janet Reno ask a federal court to fine Microsoft \$1 million per day for marketing its browser unfairly and allegedly violating the 1995 consent decree.

NOV. 4. Sen. Hatch, now chairman of the Senate Judiciary Committee, holds hearings to explore anticompetitive tactics in the software industry.

NOV. 13 - 14. Ralph Nader sponsors a conference to discuss Microsoft's business practices after blasting the company for being anti-competitive; Sun, Netscape and crusading antitrust, anti-Microsoft attorney Gary Reback agree to attend. Brad Chase, a Microsoft vice president, says the company will not participate in the conference, which he calls "an inquisition of Microsoft." But he adds that Microsoft will "probably have someone watch" the proceedings.

NOV. 16. Gates speaks at Comdex in Las Vegas.

Sources include Microsoft documents, reports filed in Congress, the Federal Election Commission, *Overtwire* by James Wallace and press reports, including some from Computerworld.

Catch-up on the HILL

Move over, Philip Morris. The computer industry wants a larger chunk of the lobbying turf on Capitol Hill.

Sure, high-technology companies aren't in the same league as the real high rollers in the spending arena. Last year, they poured at least \$20 million into in-house lobbyists and outside firms to work the trenches.

Compared with the money other industries — such as tobacco, oil, automotive and insurance — pour into Washington, that's chump change. Philip Morris Cos. could have bought a brand-new Honda Civic for such freshmen at Harvard University with the \$19.6 million it spent protecting the interests of the tobacco industry last year.

But more and more high-tech companies recognize that lobbying is an essential cost of doing business as their industry's issues increasingly intersect governmental and regulatory areas.

No longer can a high-profile CEO come to town and expect his one-shot splash to be enough to influence Congress and the executive branch. "You have to have a presence here," says U.S. Rep. Anna Eshen, a Democrat whose district encompasses the heart of the Silicon Valley. "You have to work these issues because there are thousands of people with thousands of issues that will fill the void if you don't."

IBM, the dean of the high-tech lobbying effort, shelled out close to \$4.9 million last year and, outpacing that rate, unloaded another \$5.3 million during the first half of this year. Sure, technology issues such as electronic commerce and encryption are high on Big Blue's radar screen. But with more than 500,000 employees participating in retirement and health-care plans, standard sorts of business issues also get been attention, says Chris Caine, vice president of governmental programs at IBM in Armonk, N.Y.

IBM has maintained a Washington governmental affairs office for more than 20 years and employs 30 internal lobbyists over the past 21 months, along with a few outside firms for assistance. By contrast, Microsoft employed only eight internal lobbyists but nine outside firms.

Perhaps the most surprising lobbying force on Capitol Hill, given its relative age and size, is Netscape Communications Corp.

Just 3-1/2 years old, Netscape has about 10% as many employees as Microsoft and 4% as much revenue. Yet the Mountain View, Calif., software maker spent \$600,000 on lobbying last year, nearly matching Microsoft's \$1.3 million.

Roberta Katz, general counsel for Netscape, attributes her company's relatively heavy lobbying to the experience she and CEO James Bertoldo formerly worked at McCaw Cellular.

"It was clear to me when I came to Netscape that it was as much about communications as it was about software," Katz says. "And whenever you have issues related to communications, you're going to have issues in Washington."

Netscape has been a leader on encryption issues, which consume the bulk of the company's lobbying time, Katz says.

But records also show that Netscape has been actively lobbying in Washington on antitrust issues that affect the computer industry. — Carol Silva and Kim S. Nash

HUFFING AND PUFFING

► The nascent computer industry lobbying effort has a way to go if it wants to match Bellway veterans such as labor, automotive and oil interests.

► Last year, for example, Philip Morris Cos. alone spent almost as much lobbying money as the computer industry.*

At \$10,000 per hour, how much downtime can YOU afford?

Award-winning modular reliability

According to Contingency Planning Research, poor power quality can quickly cost you thousands or millions of dollars per hour whether your business is finance, media, retail or transportation. APC's Matrix-UPS[®] was built for the 3 to 5 kVA range (between 2250 and 3750 watts), and provides modular, manageable, APC-reliable, high power availability. You get all this plus low operating costs and APC's commitment to your satisfaction.

Matrix-UPS eliminates tough installation, burdensome service contracts, high lifecycle costs and the threat of a single point failure that plague existing midrange UPSs.

Matrix-UPS has an innovative modular design which isolates any problems to its self-diagnosing,

hot swappable 'module'. No downtime. No service delays. No unnecessary risk. Matrix-UPS modularity also doubles expected battery life and has half the typical 5-year lifecycle cost.

Unlimited runtime suits any application

A Matrix-UPS 5000 with two SmartCells[®] can support eight Compaq SystemPro (4000 VA) servers for nearly 15 minutes. Eight SmartCells provide two hours of instantaneous back-up power. You can even quickly and easily add hours of runtime with SmartCell[®] XR's, which pack four times the runtime of a typical SmartCell[®], and allow you to easily extend system uptime. You'll also find that Matrix-UPS reliability costs less than you would ever imagine, and has never been more affordable.

Take the expert advice of editors and datacenter managers around the globe and avoid downtime altogether with modular Matrix-UPS[®] power protection.

OUTRAGEOUS RECRUITING

Aggressive recruiters, consultancies and vendors are using offbeat ways to lure IS talent. Their successes offer lessons for corporate IS

BY STEVE ALEXANDER

You think you're an aggressive hiring manager? Listen to this.

A legendary female information systems recruiter in the Detroit area telephoned companies and claimed to be a nun named Sister Mary. She would say there was an emergency and ask to speak to a programmer who worked there but whose name she didn't know. The first technical person who answered the phone got a pitch; if it didn't work, the fraudulent nun would ask

if anyone else in the shop might be interested.

Although such forceful tactics still raise eyebrows, they don't raise as many as they used to. "I've had job candidates offer me phone lists from where they work," confides Jeff Jones, a principal at IS recruiting firm AJM Professional Services in Troy, Mich. "I don't turn them down."

But even with competition for IS professionals intensifying, most corporate IS hiring managers still seem unwilling to try some of the unconventional recruiting techniques that appear to be working for hard-hitting IS recruiters

COMPUTERWORLD

Executive recruiter Mitchell N. Greene offers advice on how IS professionals can get the most out of a recruiter. Visit our Web site at: www.computerworld.com.

Raiding, offbeat recruiting catching on

and vendor companies.

Overreliance on daily newspaper advertising — with job fairs a longtime recruiting standby — appears to leave corporate IS lagging in the recruitment wars.

"We do run newspaper ads, but we're starting to recognize they are not getting us the volume of results we need," says Mike Giannini, director of staffing at American Century Investments, a mutual fund company in Kansas City, Mo.

Bill Hickmott agrees.

"People who are good don't have to look for jobs, because jobs come looking for them. And for somebody who is working, there is reduced incentive to pick up a newspaper and read the help-wanted section," says Hickmott, who handles technical professional staffing at Liberty Mutual Information Systems, the Portsmouth, N.H.-based information technology arm of Liberty Mutual Insurance Group in Boston. Using mostly newspaper and radio ads and job fairs, his company requires up to nine weeks to fill 15 jobs that range from entry-level development to senior project management.

But there are other ways to recruit: some are expensive, some clever and many outrageous. All require breaking out of the recruiting mold. And, although most are in the early stages, there's at least anecdotal evidence that they work.

SIGN OF THE TIMES

The shortage of 15 professionals led The MatMaxx Group in Framingham, Mass., to rent a billboard on Route 9 in Westboro, Mass., to announce the company's 15 staffing needs. The company, which is the operating company for clothing and accessories retailers T. J. Maxx and Marshall's, Inc., says it spends between \$8,000 and \$12,000 per month on the billboard. The first billboard netted two hires; the second billboard is still on display.

"We need to try some things that maybe you wouldn't have done two years ago because you didn't have to," says Bill Robinson, IS project manager of the framing division, which recently relocated from Framingham to Westboro. "Our philosophy is that newspaper ads don't really do it."

JOB LEADS FROM HEAVEN

Aggressive recruiters at outsourcing firms and vendor companies find that unconventional recruiting techniques can sometimes pay off.

When Cypress Semiconductor Corp. in San Jose, Calif., heard about layoffs at nearby competitor Cirrus Logic, Inc. last April 23, it hired an airplane to fly over Cirrus Logic's building towing a banner that said, "Cool jobs at www.cypress.com." The action was a calculated risk by a company that typically has 100 IS vacancies at a time and takes up to eight weeks to fill a job.

"I decided to do the airplane because I was looking for a different recruiting technique to attract employees quickly," says Vickie Turner, human resources manager of staffing at Cypress. The flight persuaded 10 Cirrus Logic employees — eight of them technical people

— to interview for jobs at Cypress. In the end, none of the technical people was hired. But Turner insists the airplane money was well-spent because of the considerable publicity Cypress got for the stunt, which included flying the banner over Silicon Valley's crowded Interstate Highway 880.

"I would do it again. We must try nontraditional ways of recruiting because we're getting only a very limited response from newspaper advertising," Turner says.

ON THE OUTSIDE LOOKING IN

Cisco Systems, Inc., a manufacturer of networking equipment in San Jose, uses its World Wide Web page in an unconventional recruiting campaign called "friends@cisico." After filling out a Web page questionnaire, a person curious about Cisco will get a call from a Cisco employee with the same skills who can talk about what it's like to work for the company.

"The whole idea behind this was to come up with an employment campaign to target people who were happy and successful in their current jobs," says Goff McNeal, director of employment at Cisco. "We get folks inside Cisco to volunteer to be 'friends.' If the people they talked to were hired, they got the same employee referral bonus they would have gotten if they had known those people." Currently, Cisco kumps the friends campaign results with its employee-referral campaign and thus doesn't track friends results separately. But McNeal says the friends campaign has been successful.

The Web page recruitment effort was pursued because recruiting campaigns based only on "newspaper ads are not very effective anymore. The reality is that if people are really good at what they do, they are working," McNeal says.

LOVE AT FIRST SIGHT

Dell Computer Corp. in Round Rock, Texas, used videoconferencing to extend its recruiting efforts to Recruit '97, a job fair held in New York in September in connection with the IT Forum show. Dell hired National Career Search, Inc. in Boulder, Colo., which set up PC-based videoconferences at the show. That permitted instant job interviews between 15 professionals attending the show and Dell recruiters in Texas.

Wayne Anderson, national sales director at National Career Search, says such videoconferencing speeds up the recruitment process.

"Typically, you've got swarms of people at a job fair, and your company has two or three recruiters just collecting resumes and setting up appointments to follow up. But we were doing screenings at the show, then booking job candidates up with the correct Dell recruiter in Texas," Anderson says.

Rhonda Gomez, a project specialist for career fairs and recruitment advertising in Dell's staffing department, says videoconferencing "was a way to use a show that we would have missed off otherwise because we didn't get enough people from New York. This was a low-cost alternative to appearing in person, and we're bringing in two people interviewed at the show for second interviews." □

Alexander is a freelance writer in Edina, Minn.

A 15 job candidate has become harder to find, recruiting techniques that once seem considered unusual, such as raiding competitors, are becoming more common.

"There is less bias against raiding than in the past," says Jeff Jones, a principal at IS recruiting firm April Professional Services. "Clients regularly say to us, 'We know where you can get those people.' And many times, if we can't find a client if they know where we can find a person, they say, 'We're a matter of fact, I do.' They don't want to do it but don't mind us doing it."

But nontraditional recruiting has risks: It can be expensive, and there's no guarantee of results. Lisa Fulford, vice president of recruiting and marketing at recruiting firm The Portman to Harrison, Calif., says she spent \$10,000 on a direct-mail campaign that didn't work. And some nontraditional recruiting techniques don't fit to try cost too much for her.

For instance, buying an advertising banner at Highway Dasha hockey games at the Anaheim (Calif.) Sports Arena would have cost a minimum of \$7,000 for the season.

Instead, Fulford spent \$5,000 for a two-month banner ad on America Online that will be seen only by California subscribers.

Dick Stone, an independent IT recruiter in Princeton, N.J., has developed a much lower-cost approach to recruiting: He's turned to "resume raiding" on Internet Web pages devoted to 15 job listings. Many such pages have searchable databases of 15 job candidate resumes.

"Technical people are not happy about having to answer ads and send out resumes. Posting to a database is an easy way for them to get their resumes out," Stone says. By mining resume databases, he finds candidates with five to seven years of experience.

Adela Mark Mahlin, co-author of "CareerCircle," a directory for job searching on the Internet, "A good resume minor can make six figures."

But Stone says he doesn't have much competition.

"Other recruiters could do this, but I don't think many are. They don't have time, and they are used to putting ads in the newspaper or on the Internet and waiting for responses." As a result, Stone says, resume raiding gives him a big advantage over corporate IS recruiters.

"Traditional IT departments are not doing anything unusual when it comes to recruiting. They're so far behind it's pathetic," Stone says.

IT CAREERS

Spending Time
In Milwaukee
Means
The World
To Us

INTERNATIONAL IT ASSIGNMENTS

DELUXE ELECTRONIC PAYMENT SYSTEMS is a global leader. Our technologies make millions of dollars in worldwide commerce possible. And right now, we're hiring IT professionals who are ready to travel the financial world to represent us.

You'll train for several months in Milwaukee. After you've mastered our leading-edge technologies, we'll send you on assignments that will take you to London, Sydney, or other international locations where our services and systems are utilized. Join us of the following positions and impact our expanding universe.

- **Tandem Applications Developers**
Requires experience with Pathway, COBOL or TAL.
- **IBM Applications Developers**
Requires experience with COBOL, DB2 and Assembler.
- **Client Server Developers**
C++, Delphi, Object Oriented Design
- **EFT experience on any platform is helpful**

DELUXE

DELUXE ELECTRONIC
PAYMENT SYSTEMS, INC.

If you have the technical abilities we're looking for—and the entrepreneurial approach to make things happen—we can make you a generous offer that includes an attractive salary, outstanding benefits and exceptional growth potential. Send your resume and salary requirements to: **Deluxe Electronic Payment Systems, Inc., 400 West Delux Parkway, Milwaukee, WI 53212-0536; Fax: (414) 341-5098, e-mail: fred_w_worrel@deluxedata.com**. An equal opportunity employer. Pre-employment Drug Screening Required.

Multinational innovation and an exploding revenue base have further broadened the horizon at IBM, a cutting edge transnational restructuring organization with extensive global appeal.

- Competitive compensation
- Generous benefits
- Stock options (NASDAQ: IBM)
- Long service awards
- Potential for international assignments
- Fast growing global team

FUNCTIONAL TEAM TECHNICAL ANALYST/ PROGRAMMER

**Temporary Position:
Spend the winter in
St. Petersburg, FL,
and the summer in
Syracuse, NY**

Niagara Mohawk Power Company, a joint venture with Andersen Consulting, is implementing a new state-of-the-art customer service and work process system using Andersen's Customer! software. We're currently seeking technical analysts to participate in the full life cycle of the project. The development phase will take place in St. Petersburg from November 97 through April 98, the Functional Development team will then be relocated to Syracuse for system implementation expected to last at least through November 98.

Your responsibilities will include:

- Participate in detailed design, coding and testing in St. Petersburg.
- Participate in overall systems test and resulting changes and final implementation in Syracuse.

To qualify, you must have a Bachelor's degree or equivalent, application development experience in a Windows/NT server environment, a solid understanding of customer service and related business processes, and the ability to learn Customer! business functions in detail.

Niagara Mohawk offers a relocation package, along with competitive compensation and the potential for financial incentives based on project performance. Please send resume and salary history to: Linda Clark, Organization Staffing, Niagara Mohawk Power Corp., 1304 Buckley Rd., N. Syracuse, NY 13212. No phone calls, please.

WHERE NETWORKING BEGINS

"Together we are going to redefine the network and systems management market."

• **Michael Northrup, President, Senior Forward**

Sprint is the most technically aggressive major communications carrier in the market, and Parson is the oldest and largest vendor-independent computer network services provider. These two companies are now combining efforts with the goal of redefining the market. Sprint has the only fully managed fiber network available today, and Sprint/Parson is their independent business unit located on computer network design, implementation, integration, management and support, is the most entrepreneurial, empowering company in computer networking and systems management. Sprint/Parson is experiencing phenomenal growth. We're making connections in every state and every field, and we need knowledgeable team players to drive our success. Consider Sprint/Parson today, and see how networking is done.

UNIX Administrators

SunOS, Solaris, HP-UX, AIX, NFS, NFS+, DNS, Autofs, TCP/IP, Multi-platform integration, UNIX Security, Disaster Recovery projects

Corporate America

Corporate America has a new look these days thanks to a *Fortune* 500 PC manufacturer from South Dakota. From a two-person start-up operation in 1985 to a \$5 billion global company in 1996, Gateway 2000 has taken the PC industry and corporate America by storm.

Gateway 2000 Major Accounts, Inc. is there to handle the unique needs of large-volume purchasers. Gateway Major Accounts delivers Value of Ownership: the winning combination of high benefits and low cost for the life cycle of your computer. High-quality PCs custom built for your business that go to work for you right out of the box — that's Gateway.

Want to know more about this cow-spotted business phenomenon? Call our Gateway Major Accounts representatives today, because we mean business.

GATEWAY™ E-Series desktop and Gateway Solo™ portable PCs feature Intel® Pentium processors.

"You've got a friend in the business.™"

Yahoo! Stock gets hot

As it was initially dismissed by some market watchers, one of the World Wide Web's best-known brands is slowly turning heads and eyes in the direction.

Yahoo, Inc. (NASDAQ:YHOO) has long been a Web byword and, as an e-commerce search engine, has provided many internet users with their reliable internet signpost. But that wasn't enough to impress some Wall Street analysts when the company first went public in April 1997. One analyst who attended a presentation to draw up interest in Yahoo's initial public offering results today commented by the book and decried — yet still smiling after wondering how serious the company could be when its top executives had the title "Chief Yahoo."

But that perception has changed. Keith Benjamin, an analyst at BancAmerica Robertson Stephens, a San Francisco-based investment house, says he is "increasingly impressed by Yahoo's fundamental momentum." Yahoo will continue to be a prime beneficiary of advertisers and electronic retailers that are spending more money on the Web, he says.

Yahoo was ranked as the Internet's most-visited site in October, with 7.9 million visitors. The site enjoyed Yahoo's closest rival search engines — Excite, Inc. and Excite's Web-Crawler — in a poll conducted by Research Knowledge, Inc. in Atlanta.

"Yahoo is only at the start of its competition," says Paul Maguire, an analyst at Hambrecht & Quist, Inc. in San Francisco. "What they're trying to do now is to take their user base and transform it into a membership." Yahoo hopes to do this by encouraging users to sign up for the free personalized information service or by giving them the tools to follow stock portfolios with the Yahoo Finance service, he says.

Yahoo also has been very financially sound, Maguire says. Yahoo is still the only search engine company posting profits — several quarters in a row now — and he reasons this year has more than doubled compared with last year's. — Stewart Duck

REVVED UP YAHOO

Except during the market's October dip, Yahoo's stock price has been riding on steady profits and growth

NT Workstation luring users

CONTINUED FROM PAGE 1

that the additional hardware requirements for NT Workstation were a deterrent. "Our standard desktop configuration is 32M bytes and at least a 2G-byte hard drive," he said.

Last year, Microsoft shipped nearly 3.1 million copies of NT Workstation, representing 3% of desktop operating systems, according to International Data Corp. (IDC) in Framingham, Mass. That's expected to reach 24 million units — nearly 20% market share — by the year 2000.

"That's a 937% increase from 1996, which is huge. Windows 95/98 growth rate during the same period will rise 87%," said Brian McDonough, an IDC analyst. "Windows 95/98 will remain strong. But Microsoft is aggressively repositioning Windows NT Workstation to be the business platform of choice, and users will take heed."

Although it won't supplant Windows 95/98 as the dominant business desktop for years to come, NT Workstation will account for one-third to one-half of all new business operating system shipments by the year 2000, said Jonathan

Roberts, Microsoft's Windows 95/98 and Windows NT Workstation director.

But some users are hedging their bets. Jim Marshall, an information delivery security consultant at Dow Chemical Co. in Midland, Mich., said that based on security considerations, he would rather see his 35,000 users on the NT Workstation platform vs. Windows 95. But he said the ultimate decision will be driven by timing. "The issue for us is how long after Windows 98 ships will NT Workstation 5.0 ship. If it's too long, we won't wait. We can't let the rest of the world move on while we hang back," Marshall said.

Jeff Dazell, a LAN network services administrator at Dana Corp. in Toledo, Ohio, said NT Workstation will predominate in his firm, but not immediately. "Right now, it's difficult for many of our divisions to justify the expenditure of moving to [NT Workstation] when Windows 95 is working just fine," he said. But, Dazell added, "as the leases end on our current desktop machines, all the new machines we buy will run Windows NT Workstation." □

Exchange 5.5 saves on servers

CONTINUED FROM PAGE 1

number of Exchange servers would significantly lower administrative costs. "Most of the costs of administration are not in the servers," said Bob Lewis, an analyst at Datquest in San Jose, Calif. He said Exchange's lack of an enterprise-scale directory and graphical administration tools means sites will continue to grapple with administration.

SAVINGS EXPECTED

Administrators at one 60,000-user Exchange site said they expect to eliminate about half of the site's 150 Exchange servers as a result of the upgrade, which the company estimates could cut administration costs by as much as a third.

Sites that have built highly distributed messaging networks probably aren't set up to consolidate Exchange 5.5 servers, users pointed out.

"Consolidating servers is a possibility, but it won't be a dramatic reduction, because of the way we have structured our

[Exchange network]," said Bob Cavallaro, director of advanced technology at American International Group (AIG). The New York-based insurer already has centralized public folders and uses separate servers to run E-mail. The increased server headroom may keep AIG from adding more E-mail servers, Cavallaro said.

Several sites said they plan to reduce the number of mail servers they run but are waiting for improved clustering support to be added to Exchange before they do so. Microsoft is expected to provide that functionality in the next release, code-named Platinum, due in the middle of next year.

"If you are going to have a lot of users running on each server, you want to make sure the server is extremely reliable," said Bob Winterston, systems specialist at Consolidated Edison Company of New York, which is moving 100,000 users from Microsoft Mail and IBM Professional Office System to Exchange. Clustering will add the level of reliability that Confid is looking for, he explained.

In the meantime, Exchange 5.5 means the utility can relax some of the limitations it has imposed on E-mail users now that storage isn't an issue, Winterston said. □

CA eyes remote PC management

By Patrick Dryden

COMPUTER ASSOCIATES International, Inc. this week will expand the PC control capability of its enterprise management suite at Comdex/Fall '99 in an effort to reduce support hassles for users and increase acceptance by vendors.

CA plans to post a free upgrade to the framework version of Unicenter TNG, a subset of the full suite that several system vendors bundle with servers to enable some basic management functions.

Hoping to snare similar bundling deals with PC makers, CA will enable the Unicenter TNG framework version to start new PCs equipped with "wake-up" triggers in the motherboard and network interface. Then central operators could apply automated tools to configure, control or upgrade remote PCs, even if users shut them down at night.

"I applaud any effort to build management in at the factory, because the capability must be pervasive to make a significant change," said Jonathan Burnier, an analyst at Illuminix, Inc. in Nashua, N.H.

Intel Corp. and some PC vendors are expected to announce

plans to provide CA's framework software.

CA last week announced plans to add remote-control capabilities to all its management products when it acquired privately held Avalan Technology, Inc. in Holliston, Mass., for an undisclosed amount.

Avalan's Remotely Possible software can control Windows PCs across a network or modem connection. CA will add this to its ARCserve backup and local LAN virus protection tools. CA also will offer remote-control options for Unicenter TNG and Paradigm Service Desk. □

COMMENTARY

Think tribally, fail globally

By Allan E. Alter

You're not my customer. You're not my boss. It's not my deadline. I can't be bothered. Have you ever said or thought that about someone else in IS? Have you ever shafted, by commission or omission, someone in another part of your IS organization?

If so, you're part of the reason IS has such a bad reputation in many organizations. The problem is tribalism.

My dictionary defines "tribalism" as "strong in-group loyalty" or "exaltation of the tribe above other groups," and it defines "clannish" as "tending to associate only with a select group of similar background or status." That sure sounds like life inside IS. The typical IS organization is an amalgamation of tribes: data center, network administrators, help desk, management, developers, programmers.

Some tribes have distinct personalities. Help desk staffers usually are extroverts; there's more noise and chummi-

ness at their conferences than at other IS events. Quality assurance professionals are zealots who believe they're on a mission from the quality gods.

Some tribes regularly knock heads. When a programmer looks at a quality assurance person, he sees a pest who keeps him from completing his work.

One data center manager compares senior network and systems technicians to surgeons. "They always think they're

above everyone else," he says. "They think they know best."

The IS tribes don't talk to one another enough, and they stick to their own technical priorities. When a project is running around, don't expect one tribe to go out of its way to help another, a former CIO told me.

Users see this. To them, it's like walking into a garage and getting three explanations of your repair bill from three different mechanics.

"When we talk with one person in IS, we don't feel we are talking to everyone in IS," a line manager told me. That results in delays, wasted time and another black eye for those disgruntled, dense IS people.

Ultimately, the whole business suffers. When IS thinks tribally, companies can fail globally. IT initiatives that require an international (or even just cross-divisional) perspective are held back by

people who are oblivious to the big picture.

What should you do? First, don't try to abolish the tribes. You can't, because organizing into tribes is the most comfortable and natural way for highly skilled and specialized individuals to work.

But don't let tribalism overwhelm the common good. Encourage communication, then go the extra mile to make it happen. Bring your whole IS organization together in meetings, then use Q&A sessions and social time to get them to talk.

For critical positions, choose managers who make intradepartmental communication a priority. Never stop talking about business priorities. And if you're in an IS association, encourage it to get a dialogue going.

Unless IS tribes can communicate with one another, they'll never be able to communicate effectively with that other, even more alien tribe: users. □

It's the atoms, stupid

By David Moschella

During the past few years, one of the most widely shared pieces of conventional Web wisdom has been that the world of bits will change much more than the world of atoms.

The logic has seemed infallible: Because pure information businesses such as banking, insurance and publishing can be fully replicated in cyberspace, those sectors should surely be the most radically transformed portions of our economy. Someday, they probably will.

But for now, things are evolving very differently. Many of the major bit-based industries seem to be passing through the Web's early years relatively unscathed. Outside the computer business itself, Web-based newspapers and magazines have established only a minor presence. Ditto online entertainment, be it music, drama or sports. From a financial services perspective, how much has banking or insurance really changed?

In contrast, an increasing number of atom-based industries are on the verge of revolution. Amazon.com clearly has created panic at rival booksellers Borders and Barnes & Noble, as has Dell Computer among PC resellers. More recently,

the automobile dealer business, with its abnormally secretive sales and pricing culture, has shown signs of imminent collapse as customers flock to the Web to get accurate pricing information.

To the surprise of many, these atom-based Web success stories have become the signature examples of what consumer electronic commerce means.

The explanation is simple. The savings atom-based companies gain by bypassing traditional channels are more compelling than the enhanced services that characterize most online bit-based offerings. In the case of books, PCs and cars, consumers directly benefit from the real costs that are taken out of the distribution system. Sure, there are many non-price-related

benefits, such as convenience, customization and choice. But in most cases, those are of secondary importance.

In contrast, in many bit-based businesses, especially those supported by advertising, there's little consumer cost to be reduced. Therefore, Internet-based systems compete mostly on convenience and functionality. With the Web still immature, those enhanced services, although certainly possible, often are risky. The result is that very few bit-based businesses have been truly revolutionized.

What about online stock trading and travel services? Aren't those equally compelling symbols of a bit-based revolution? Only partially. In both cases, the Web basically is being used to replace telephone calls—essentially eliminating a customer-service agent. Clearly, that's just another form of disintermediation. Once again, prices, not enhanced services, drive the demand.

In other words, the real consumer electronic-commerce excitement on the

Web is consistently found in areas where buyers can save money. Perhaps that shouldn't be surprising, but it's still often overlooked. It also has profound implications for near-term Web evolution.

Businesses that are primarily supported by advertising will find it more difficult to save consumers money. Perhaps less apparent, industries such as insurance and banking won't take off on the Web until they offer a more tangible value proposition. They almost totally have failed to do that. Indeed, banks, with their recent efforts to charge for ATM use, appear to be heading in the opposite direction.

As you examine your company's Web strategy, keep in mind one simple question: "What can we do online that saves our customers money?" If the answer is "Not much," the Web probably won't revolutionize your core business any time soon. But if there are areas of potential savings, you'd best get cracking. Because if you don't, someone else certainly will. And if you're in the business of selling atoms, be doubly careful. You're now clearly where the action is. □
